STAMPED AMPHORA HANDLES FOUND IN THE ATHENIAN AGORA 1931 1932

Stamped Amphora Handles Found in the Athenian Agora (1931-1932)

Introduction:

In the 1930s, during the excavation of the Athenian Agora, archaeologists discovered a large number of stamped amphora handles. These handles bore various marks and symbols, providing valuable insights into the economic and social life of ancient Athens.

What are Amphora Handles?

Amphorae were large ceramic vessels used for transporting and storing liquids, such as wine, olive oil, and grains. The handles, which served as points of attachment for lifting and carrying, were often adorned with stamped marks that identified the amphora's contents, origin, or ownership.

Excavations in the Athenian Agora:

The stamped amphora handles were unearthed during the American School of Classical Studies at Athens' excavations of the Athenian Agora, the civic and commercial center of ancient Athens. The excavations, conducted between 1931 and 1932, yielded a vast collection of artifacts, including these handles.

Significance of the Find:

The stamped amphora handles provided researchers with a rich source of information about Athenian trade, taxation, and manufacturing practices. The marks and symbols on the handles allowed scholars to identify the producers, distributors, and consumers of the goods stored in the amphorae.

Questions and Answers:

- **What information did the stamped amphora handles reveal?** They provided insights into Athenian trade, taxation, and manufacturing practices, as well as the origin and ownership of the goods stored in the amphorae.
- **Why were the handles stamped?** The stamps served as a form of identification and control, indicating the contents, origin, or ownership of the amphorae.
- **How were the handles used?** The handles facilitated the lifting and carrying of the heavy amphorae, which could hold up to 40 liters of liquid or solid goods.
- **Where were the amphorae produced?** The marks on the handles often identified the pottery workshops or regions where the amphorae were manufactured.
- **What was the significance of the excavations?** The excavations of the Athenian Agora, including the discovery of the stamped amphora handles, provided a unique glimpse into the daily life and economy of ancient Athens.

What is GSM-R used for? Global System for Mobile Communications – Railway (GSM-R) is a radio communication system offering a wide range of voice and data services needed for daily operation of railways. GSM-R provides telephony, SMS and data services, as do public GSM networks.

What is the difference between GSM and GSM-R? GSM-R is based on the cellular GSM technology, with further enhancements specific to the requirements of railroad operation, such as train control.

What are the functions of GSM-R? GSM-R delivers direct radio driver-signaller communications at all times. This includes areas such as tunnels and deep cuttings, where radio communications have not previously been possible, therefore the

system: improves safety for drivers, maintenance teams and passengers.

What are the advantages of GSM-R? As well as providing a set of standardized operational and safety features for national and cross-border rail networks, GSM-R also enables the seamless integration of regional services and applications such as the European Train Control System (ETCS).

What is the main purpose of GSM? It operated as a substitute for the 1 G cellular networks. GSM is essentially a digital, open cellular radio network and functions in nearly every country. GSM is used not just for voice calls but for data storage and messages.

What is the difference between GSM-R and LTE? LTE-R when compared to GSM-R offers several advantages, like low latency, higher data capacity and high security. LTE-R can also support passenger information applications, closed-circuit TV (CCTV), traffic management, ticketing and other services on a single network.

What is the range of GSM-R? A GMRS user can expect a communications range of one to twenty-five miles depending on station class, terrain, and repeater use.

What is the bandwidth of GSM-R? GSM-R uses a specific frequency band, which can be referred to as the "standard" GSM-R band: Uplink: 876–880 MHz used for data transmission. Downlink: 921–925 MHz used for data reception.

What are the 3 different types of GSM? The GSM network is divided into three major systems: the switching system (SS), the base station system (BSS), and the operation and support system (OSS). The basic GSM network elements are shown in Figure 2.

What are the three main systems the GSM network depends on? The GSM network architecture is typically divided into three major systems: The Mobile Station (MS), the Base Station Subsystem (BSS), and the Network Subsystem (NSS).

Is GSM-R 2G? Train drivers use radio to keep in touch with rail traffic regulators and to send/receive radio alerts when necessary. It is also used to transmit digital information between the driver's cab and the equipment on the ground, in particular for ERTMS. Today, this radio operates using GSM-R (2G) technology.

What are the five uses of GSM?

What is the difference between GSM-R and Tetra? GSM-R: Modified from the GSM standard, which is a public radio network, for use in railway operations. Spectrum Efficiency: TETRA: Offers four channels per 25 kHz, making it more spectrum efficient1. GSM-R: Provides eight channels per 200 kHz.

What are the pros and cons of GSM? The benefits of GSM include a secure network, extensive coverage, and compatibility with a broad range of accessories and handsets. On the other hand, one of the most significant disadvantages of the GSM is that many users share the same bandwidth. This may result in bandwidth limitations and interference.

How does ETCS work? The train control (signalling) element of ERTMS is called the European Train Control System (ETCS). ETCS transmits a 'movement authority' to the train, specifying the distance that it is permitted to travel and data about the track ahead, such as speed restrictions and gradients.

Who uses GSM technology? AT&T and T-Mobile are GSM wireless networks. Code-division multiple access (CDMA) is used mainly in the US. Verizon uses CDMA technology and is the largest wireless carrier in the US, but CDMA's market share around the world is estimated to be less than 20%.

How important is GSM? While a high GSM may suggest a fabric is hard-wearing, it does not determine the quality of the fabric. The weight of the fabric is very much dependent on the fabric's use. For example, a light summer dress will obviously require a lower GSM than a warm winter coat. GSM also affects how much a fabric drapes.

How do you explain GSM? GSM stands for Global System for Mobile Communication. GSM is an open and digital cellular technology used for mobile communication. It uses 4 different frequency bands 850 MHz, 900 MHz, 1800 MHz, and 1900 MHz. It uses the combination of FDMA and TDMA.

What is the latency of GSM-R? The maximum transmission rate of GSM-R per connection is 9.6 kbit/s, which is sufficient only for applications with low demands; message delay is in the range of 400 ms, which is too high to support any real-time

application and emergency communication [10].

Is GSM a 4G or 5G? GSM - the Global Standard for Mobile Communications 2G GSM was the first generation of mobile comms for consumers.

How do I know if my phone is GSM or LTE? Android: Go to Settings, click on About phone, then scroll to Status and look for an MEID, ESN or IMEI number. If you see both, your device supports both CDMA and GSM.

What is the GSM module used for? The GSM module plays a crucial role in the communication between devices and the GSM network. It is responsible for establishing and maintaining the communication link between the device and the network. The module also handles the encryption and decryption of data, which ensures the security of the communication.

What does a GSM do? GSM is a digital cellular technology that provides mobile data and voice services across devices. Global System for Mobile Communication (GSM) is one of the second-generation telecommunication standards (2G). GSM simply is a wireless network for transmitting data across mobile devices.

What GSM is good for? 200 gsm paper is heavier stock, making it ideal for document covers or thick sheets. Card, ideal for document covers. 250 gsm paper is commonly used for greetings cards, invitations and booklet/brochure covers. Thick board stock, ideal for book covers, business cards etc.

What is the benefit of GSM? Advantages of GSM (Global System for Mobile Communications) technology: Global compatibility: GSM is the most widely used mobile communication standard in the world, with over 4 billion users globally. This means that GSM devices can be used in most countries and roaming between countries is usually possible.
