WRF Model Sensitivity to Choice of Parameterization: Questions and Answers

1. What is parameterization in weather forecasting?

Parameterization is a mathematical method used in numerical weather prediction (NWP) models to represent processes that occur at scales smaller than the model's grid spacing. These processes include clouds, precipitation, and turbulence.

2. Why is the choice of parameterization important?

The choice of parameterization can significantly affect the performance of NWP models. Different parameterizations represent the same processes in different ways, THE EDUCATION OF LEV NAVROZOV A LIFE IN THE CLOSED WORLD ONCE CALLED RUSSIA

leading to variations in model forecasts.

3. What is WRF model?

The Weather Research and Forecasting (WRF) model is an NWP model developed by the National Center for Atmospheric Research (NCAR) and its partners. WRF offers a wide range of physical parameterization options to represent various atmospheric processes.

4. How can the WRF model be used to evaluate the sensitivity of parameterization?

By conducting sensitivity experiments, researchers can compare the performance of WRF model simulations using different parameterization schemes for the same weather event or period. This allows them to identify the parameterizations that have the most significant impact on model forecasts.

5. What are some examples of parameterizations that WRF model users can choose from?

- **Microphysics:** Bulk, bin, and spectral microphysics schemes
- **Cumulus convection:** Kain-Fritsch, Betts-Miller, and Tiedtke schemes
- **Planetary boundary layer:** Yonsei University, Mellor-Yamada-Janjic, and MYNN schemes
- **Land surface:** Noah, RUC, and Pleim-Xiu schemes
