You Don't Know JS: This, Object, and Prototypes

What is "this"?

"this" is a special keyword that refers to the current execution context. In most cases, it refers to the object that called the function. For example, if you have a method called `greet` that is called on an object called `person`, then `this` inside the `greet` method will refer to the `person` object.

What are Object Prototypes?

Object prototypes are objects that are used to inherit properties and methods. When you create a new object, it is automatically assigned the prototype of its constructor function. For example, if you have a `Person` constructor function, then all objects created with that constructor will have the `Person` prototype.

How do Prototypes Work?

When you access a property or method on an object, the JavaScript engine will first look for the property or method on the object itself. If it cannot find it, it will then look for it on the object's prototype. This process continues until the property or method is found or the prototype chain is exhausted.

Why are Prototypes Important?

Prototypes are important because they allow you to share properties and methods between multiple objects. This can help to reduce code duplication and make your code more efficient.

How can I Use Prototypes?

You can use prototypes by setting the `prototype` property of a constructor function. For example, the following code creates a `Person` constructor function and sets its prototype to an object with a `greet` method:

```
function Person() {  
  
}  
  
Person.prototype.greet = function() {  
  console.log("Hello, my name is " + this.name);  
};
```
