**What term describes the circular path the shuttle makes in space?** The Short Answer: An orbit is a regular, repeating path that one object in space takes around another one. An object in an orbit is called a satellite.

**How many questions are on the benchmark test?** How long are the Benchmark assessments? Each of the three Benchmarks has been constructed to be taken within a single class sitting. Each test contains 30 multiple choice questions. Generally, students should take between 30 and 45 minutes to complete an assessment.

**What is orbit class 6?** The path taken by the planets to go around the Sun is known as the orbit. Explanation: The path of revolution of each planet around the Sun is either egg-shaped or elliptical. This path is known as the orbit.

**What is a circular path of a space object moving around another space object called?** An orbit is a regular, repeating path that one object takes around another object or center of gravity.

**What happens if you fail a benchmark test?** Students are given remediation in their reports based on their incorrect answers. So even if they fail, they can get the help they need to get back on track.

**Can you retake a benchmark test?** If they receive assistance or don't take the test seriously, their score may be inappropriate for their skill level. By extension, their pathway lessons could be too easy or too difficult for them. If you believe this is the case, you can reassign the Benchmark and have the student retake it.

**What is a good grade on a benchmark?**

**What is solar system grade 6?** The solar system consists of the Sun and everything that orbits, or travels around, the Sun. This includes the eight planets and their moons, dwarf planets, and countless asteroids, comets, and other small, icy objects. However, even with all these things, most of the solar system is empty space.

**Does perihelion affect temperature?** There's more to the story: Says Spencer, "the average temperature of the whole earth at perihelion is about 4oF or 2.3oC lower than it is at aphelion." (See the global temperature data at the GHCC web site.) Our planet is actually colder when we're closer to the Sun.

**What are perigee and apogee?** The point in the moon's orbit where it is farthest from the earth is called apogee, while it's closest approach is known as perigee. Earth is at its maximum distance from the sun at aphelion, and at its minimum distance at perihelion. These orbits produce cyclical changes in the height of the tides.

**What is a small object that moves around a planet called?** A satellite is an object which revolves around a planet in a fixed orbit. It can be an artificial satellite which is placed intentionally into a planets's orbit or a natural satellite like moon.

**What is the weight of an object?** In science and engineering, the weight of an object is the force acting on the object due to gravity. Weight as a vector quantity, the gravitational force acting on the object. Weight, gravitational force of attraction on an object, caused by the presence of a massive second object, such as the Earth or Moon.

**Which force causes a ball to move in a circle?** A centripetal force is a net force that acts on an object to keep it moving along a circular path.

**Is benchmark good or bad?** Benchmarks are incredibly useful data points for anchoring what performance can and should look like. However, my recommendation is to build out benchmarks using your own data whenever possible, and only optimize toward these benchmarks when there's a clear tie to business outcomes.

**How can I test my benchmark?**

**How long is a benchmark test?** The suggested time is approximately 60-90 minutes for testing.

**How important is a benchmark test?** Benchmarking and benchmark assessments help educators establish best practices for teaching and learning, compare students

to one another in terms of achievement, and rank schools in terms of achievement. Overall, educators use benchmark assessments to improve performance.

**What is the highest score you can get on a benchmark test?** 2.1 Overall Scale Score This overall scale score is based on the operational items the student attempted. Students take an on-grade level benchmark that only consists of items measuring on-grade level standards. Thus, the range of possible scores on each benchmark is a subset of the 500 to 1500 total scale-score range.

**How do I get rid of benchmarks?**

**Is a 1.5 grade good?** A 1.5 GPA is indicative of below-average academic performance, typically equating to 'D+' or 'D' grades in coursework. This GPA suggests significant challenges in understanding and meeting the requirements of your studies, highlighting a critical need for academic intervention and improvement strategies.

**Which benchmark score is best?** For editing photos, video, or other digital content We recommend a PCMark 10 Digital Content Creation score 3450 or higher. If you need a PC for complex rendering, real-time graphics, or gaming, we recommend using our popular 3DMark benchmark to measure and compare system performance.

**What is the best grade score?** A+, A, A- indicates excellent performance. B+, B, B- indicates good performance. C+, C, C- indicates satisfactory performance.

**What is the path through space called?** A trajectory or flight path is the path that an object with mass in motion follows through space as a function of time.

**What is a space shuttle called?** Space Shuttle orbiter. Launch vehicle(s) Space Shuttle. The Space Shuttle, composed of an orbiter launched with two reusable solid rocket boosters and a disposable external fuel tank, carried up to eight astronauts and up to 50,000 lb (23,000 kg) of payload into low Earth orbit (LEO).

**Is a space shuttle in a circular orbit?** Circular Orbit This happens when the gravitational pull of the Earth is exactly balanced by the shuttle's inertia, which tends to move it in a straight line. The combination of these two forces creates a stable loop, allowing the shuttle to keep orbiting at a constant distance from the Earth's

center.

**What is the circular motion of satellites?** In uniform circular motion, a body moves in a circle. The acceleration is constant. The velocity changes due to a constant change in direction, but the speed remains constant. The motion of a satellite in a circular orbit is uniform circular motion.

**What is the path of a projectile through space called?** The object is called a projectile, and its path is called its trajectory.

**What is the path of the Earth through space called its orbit?** An orbit is a repeatable path an object takes around another object. The Earth orbits the sun and the moon; and many satellites orbit the Earth. Orbits can either be elliptical or circular, since a circle is a specific type of an ellipse.

**What is the difference between circular orbit and elliptical orbit?** Answer: In fact, a circular orbit is just a special case of an elliptical orbit. Elliptical orbits are stable, possessing the same amount of total energy over the orbit as circular orbits.

**What does a space station look like?** At night, the ISS is visible from Earth, appearing as a luminous moving point of light and rivaling the brilliant planet Venus in brightness. It can be seen without the use of a telescope by night sky observers who know when and where to look. For more information on how to see and track the ISS, check out our guide.

**How does force influence a rocket?** A heavier rocket needs more force to accelerate it. Sometimes written as  $F=ma$ , or  $a=F/m$ , Newton's second law describes that the heavier an object, the more force you need to accelerate it. It also means that a bigger force will cause a bigger acceleration, so a bigger thrust will accelerate a rocket more.

**How do space shuttles come back to Earth?** When the astronauts want to return to Earth they turn on the engines, to push their spacecraft out of orbit. Gravity then pulls the spacecraft back towards the Earth. The spacecraft may be slowed to a safe landing speed by parachutes.

**When was the space shuttle invented?** On September 17, 1976, NASA publicly unveils its first space shuttle, the Enterprise, during a ceremony in Palmdale,

California. Development of the aircraft-like spacecraft cost almost \$10 billion and took nearly a decade.

**How do astronauts get to the ISS?** Docking ports allow other spacecraft to connect to the space station. New crews and visitors arrive through the ports. Astronauts fly to the space station on the Russian Soyuz. Robotic spacecraft use the docking ports to deliver supplies.

**How did the space shuttle land?** A parachute is deployed from the back to help stop the orbiter. The parachute and the speed brake on the tail increase the drag on the orbiter. The orbiter stops about midway to three-quarters of the way down the runway. After landing, the crew goes through the shutdown procedures to power down the spacecraft.

**Why do satellites revolve in elliptical orbit?** Orbits are elliptical because of Newton's Law of Gravity (bodies attract each other in proportion to their mass and inversely proportional to the square of the distance between them). All worked out by Kepler some years ago. A circular orbit is a special (and very unlikely) case of an elliptical orbit.

**What is meant by centrifugal force?** What Is Centrifugal Force? Centrifugal force is a pseudo force in a circular motion which acts along the radius and is directed away from the centre of the circle.

**How do orbits work in physics?** Orbits are the result of a perfect balance between the forward motion of a body in space, such as a planet or moon, and the pull of gravity on it from another body in space, such as a large planet or star.
