Solutions for Gravimetric Analysis Exercises

Gravimetric analysis is a technique used in analytical chemistry to determine the amount of a substance in a sample by measuring the mass of the precipitate formed when it reacts with a specific reagent. Here are some common questions and answers to help you solve gravimetric analysis exercises.

1. What is the molar mass of a substance?

The molar mass of a substance is the sum of the atomic masses of all the atoms in its molecular formula. For example, the molar mass of sodium chloride (NaCl) is $22.99 + 35.45 = 58.44$ g/mol.

2. How do you prepare a standard solution?

A standard solution is a solution of known concentration. To prepare a standard solution, dissolve a known weight of the analyte (the substance being analyzed) in a known volume of solvent. The concentration of the standard solution can be calculated using the following formula:

Concentration = (Weight of analyte / Molecular weight of analyte) / Volume

3. What is a precipitate?

A precipitate is a solid that forms when two solutions react and the reaction product is insoluble in the solvent. In gravimetric analysis, the precipitate is often used to determine the concentration of the analyte.

4. How do you calculate the percentage composition of a substance?

The percentage composition of a substance is the mass of each element in the substance expressed as a percentage of the total mass of the substance. To calculate the percentage composition of a substance, divide the mass of each element by the total mass of the substance and multiply by 100%.

5. What are some common sources of error in gravimetric analysis?

Some common sources of error in gravimetric analysis include:

- Inaccurate weighing of the sample
- Incomplete precipitation
- Contamination of the precipitate
- Loss of precipitate during filtration or drying
