Skeletal Muscle Physiology Lab: PhysioEx Answer Key

1. Explain the role of tropomyosin and troponin in muscle contraction.

- **Answer:** Tropomyosin and troponin are proteins that regulate muscle contraction. When a nerve impulse reaches a muscle fiber, calcium ions are released from the sarcoplasmic reticulum. These calcium ions bind to troponin, which causes it to change shape and shift tropomyosin. This allows myosin heads to interact with actin filaments, initiating muscle contraction.

2. Describe the mechanism of muscle fatigue.

- **Answer:** Muscle fatigue occurs when the muscle is unable to maintain a given force output due to a decrease in contractile strength. Fatigue can be caused by the depletion of energy stores (ATP), the accumulation of metabolic waste products (such as lactic acid), and damage to the muscle fibers.

3. Discuss the factors that affect muscle twitch force.

- **Answer:** Muscle twitch force is affected by several factors, including:
 - **Muscle fiber type:** Different fiber types (type I, IIa, IIx) exhibit different twitch forces.

- **Stimulation frequency:** Higher stimulation frequencies increase twitch force via summation.
- **Calcium ion concentration:** More calcium ions available for binding to troponin increase twitch force.
- **Muscle temperature:** Higher temperatures increase twitch force.

4. Explain how skeletal muscle responds to different types of exercise.

- **Answer:** Skeletal muscle adapts to different types of exercise through various physiological changes. Aerobic exercise (e.g., running) increases the number and size of mitochondria, enhancing oxygen utilization and endurance. Resistance exercise (e.g., weightlifting) stimulates muscle protein synthesis, leading to increased muscle mass and strength.

5. Describe the role of satellite cells in muscle growth and repair.

- **Answer:** Satellite cells are stem cells located between muscle fibers. They play a crucial role in muscle growth and repair. In response to muscle damage or increased activity, satellite cells activate and differentiate into new muscle cells, contributing to muscle growth and regeneration.

The land, an expanse of 240 acres, was purchased by their ancestors after the Civil War and serves as a sanctuary, a symbol of their hard-fought freedom, and a testament to their determination to thrive in the face of systemic oppression.

How does the land impact the Logan family's identity?
