In 1994, the literary world celebrated the awarding of the Nobel Prize in Literature to renowned Japanese author Kenzaburo Ōe. This prestigious recognition was bestowed upon Ōe for his "wholly personal, powerfully expressive writings that strike a nerve in the contemporary condition."

### Why Ōe Deserved the Nobel Prize

Ōe's literary output is characterized by its profound exploration of themes related to human suffering, alienation, and the search for meaning in the aftermath of World War II. His works grapple with the complexities of modern society, particularly the struggles of individuals facing physical, mental, and societal challenges.

Through his deeply personal and evocative writing style, Ōe illuminates the inner lives of characters grappling with profound loss, trauma, and the search for redemption. His narratives often feature marginalized and vulnerable figures, offering a nuanced portrayal of the human condition.

### Notable Works

Some of Ōe's most acclaimed works include:

- **A Personal Matter** (1964): Explores the challenges faced by a father caring for his disabled son.
- **The Silent Cry** (1967): Depicts the aftermath of a nuclear explosion and its impact on a survivor.

- **Teach Us to Outgrow Our Madness** (1969): A powerful anti-war allegory set during a military coup.

### Interesting Facts about Kenzaburo Ōe

**What is image processing in LabVIEW?** Abstract— Image processing is a methodology to perform some operations on an image, so as to get enhanced image or to extract some helpful information from it. It's a sort of signal process during which input is an image and output could also be image or characteristics/features related to that image.

**What is digital image processing in AI?** Digital Image processing is the class of methods that deal with manipulating digital images through the use of computer algorithms. It is an essential preprocessing step in many applications, such as face recognition, object detection, and image compression.

**What is digital image processing steps?** The basic steps involved in digital image processing are: Image restoration: This involves removing degradation from an image, such as blurring, noise, and distortion. Image segmentation: This involves dividing an image into regions or segments, each of which corresponds to a specific object or feature in the image.

**How digital image processing is used in remote sensing?** In remote sensing, a digital image acquired through different sensors is represented in the form of a matrix consisting of pixels arranged in rows and columns. Each pixel has a unique location and are indexed according to their radiometric resolution, for example, pixels of a 8-bit image is indexed between 0-255.

**What are the three types of image processing?** There generally three types of processing that are applied to an image. These are: low-level, intermediate-level and high-level processing which are described below.

**How do you display images in Labview?** You can access the Image Display control by right-clicking the front panel and selecting Vision. To display an image, wire the image output of an NI Vision VI into the Image Display terminal on the block diagram, as shown in the following figure.

**What are the four applications of digital image processing?**

**What are the four types of digital images?** The images types we will consider are: 1) binary, 2) gray-scale, 3) color, and 4) multispectral. Binary images are the simplest type of images and can take on two values, typically black and white, or 0

and 1. A binary image is referred to as a 1-bit image because it takes only 1 binary digit to represent each pixel.

**What is the difference between digital image and digital image processing?** A digital image processing is applied to digital images (a matrix of small pixels and elements). For manipulating the images, there is a number of software and algorithms that are applied to perform changes. Digital image processing is one of the fastest growing industry which affects everyone's life.

**What is the principle of digital image processing?** It comprises the four basic steps, which include image correction/restoration, image enhancement, image transformation, and image classification. Image restoration is basically aimed to compensate the data errors, noise, and geometric distortions introduced during the scanning, recording, and playback operations.

**Why do we need digital image processing?** Digital image processing is essential for a variety of reasons: Enhancement: It allows us to improve the quality of images by adjusting contrast, brightness, and sharpness. Restoration: It helps restore old or degraded images by reducing noise, removing artifacts, and enhancing details.

**What are the basic elements of digital image processing?** Elements of digital image processing systems: • The basic operations performed in a digital image processing systems include (1) acquisition, (2) storage, (3) processing, (4) communication and (5) display. Image acquisition. equipments.

**Which sensors are used for digital image processing?** CCD sensors are used for high end broadcast quality video cameras, and CMOS sensors dominate in still photography and consumer goods where overall cost is a major concern. Both types of sensor accomplish the same task of capturing light and converting it into electrical signals.

**What are the two major tasks of digital image processing?** Digital image processing focuses on two major tasks - improvement of pictorial information for human interpretation and processing of image data for storage, transmission and representation for autonomous machine perception.

**What technology is used in digital image processing?** Digital signal processor (DSP) DSP chips have since been widely used in digital image processing. The discrete cosine transform (DCT) image compression algorithm has been widely implemented in DSP chips, with many companies developing DSP chips based on DCT technology.

**What are the disadvantages of a digital image processing system?**

**What are the algorithms used in image processing?** SIFT (Scale-invariant feature transform) algorithm: SIFT is an algorithm to identify and define local features in images. SURF (Speeded Up Robust Features) algorithm: SURF is a robust local feature detector. Richardson–Lucy deconvolution algorithm: This is an image de-blurring algorithm.

**How do I import an image into LabVIEW?**

**How to convert image to array in LabVIEW?** The best way to convert an image to an array of values is by using either the function IMAQ ImageToArray or IMAQ ColorImageToArray. These functions will take an IMAQ image reference and break it down into its individual pixel values.

**How do I view data in LabVIEW?** LabVIEW displays the numeric or waveform data from the file specified in the Filename section of the Configure Read From Measurement File dialog box in a front panel indicator.

**What is meant by image processing?** Image processing is the process of transforming an image into a digital form and performing certain operations to get some useful information from it. The image processing system usually treats all images as 2D signals when applying certain predetermined signal processing methods.

**What is image processing software used for?** Image processing software is software that's designed to manipulate digital images. In particular, it captures the image if that hasn't already been done, it converts it to a digital form, and it performs a manipulation or manipulations on it.

**What does the image processing module do?** Conceptually, the Image Processing Module (IPM) consists of two parts, IPAPI - An Image Processing Application Program Interface -- This is the declarative interface that other components in the D/R architecture can use to create, manipulate, configure and execute various image processing algorithms.

**What is neural image processing?** - Neural Network Image Processing improves image quality. - The Neural Network Upscaling Tool increases the pixel resolution while retaining the high definition of the original. Read on to learn more about how they work and what they do.
