What is the difference between a random variable and a stochastic process? A

A stochastic process, also known as a random process, is a collection of random variables that are indexed by some mathematical set. Each probability and random process are uniquely associated with an element in the set. The index set is the set used to index the random variables.

What is the autocorrelation function of a stochastic process? Because for each

pair the value $C_X(t, s)$ is a number, the autocovariance function is a deterministic (i.e., not random) function of two time points. The (ensemble) autocorrelation function of a stochastic process is the function $R_X(t, s)$ which maps $(t, s) \in E \times E$ to $E[X(t)X(s)]$.

What is the cross correlation of a stochastic process? The cross-correlation of a

pair of jointly wide sense stationary stochastic processes can be estimated by averaging the product of samples measured from one process and samples measured from the other (and its time shifts).

What is the difference between a random vector and a stochastic process? A

A random vector is a generalization of a single random variables to many. A stochastic process is a sequence of random variables, or a sequence of random vectors (and then you have a vector-stochastic process).

Why use stochastic instead of random? The terms stochastic process and

random process are used interchangeably, often with no specific mathematical space for the set that indexes the random variables. But often these two terms are used when the random variables are indexed by the integers or an interval of the real line.

What are the four types of stochastic processes? It has four main types – non-

stationary stochastic processes, stationary stochastic processes, discrete-time

stochastic processes, and continuous-time stochastic processes.

What is the autocorrelation of a random variable? Autocorrelation, sometimes known as serial correlation in the discrete time case, is the correlation of a signal with a delayed copy of itself as a function of delay. Informally, it is the similarity between observations of a random variable as a function of the time lag between them.

What does a stochastic process depend on? A stochastic process is defined as a family of random variables indexed by a parameter, often time, where each variable represents a different outcome. It involves the study of random changes that evolve over time, characterized by trajectories and probability density functions.

What is stochastic variable How does it help in simulation? A stochastic simulation is a simulation of a system that has variables that can change stochastically (randomly) with individual probabilities. Realizations of these random variables are generated and inserted into a model of the system.

What is a stochastic process in Markov chain? A stochastic process is a family of random variables $\{X_t : t \in T\}$ where the index t belongs to some parameter set T , and each of the random variables can take the same set of possible values. The possible values that the random variables can take is known as the state space.

What is Brownian motion in stochastic process? 6.1 Brownian Motion This motion produces a kind of random force. The collision number caused by the pollens is very large, up to about 10^{21} . Therefore, the motion of pollen grains can be viewed as a stochastic motion caused by a large amount of tiny force. Let B_t be the position of a pollen grain at time t .

What is the path of a stochastic process? A sample path of a stochastic process is a particular realization of the process, i.e. a particular set of values $X(t)$ for all t (which may be discrete or continuous), generated according to the (stochastic) 'rules' of the process.

What is the difference between a random process and a random variable? A random variable is a function $X(e)$ that maps the set of experiment outcomes to the set of numbers. A random process is a rule that maps every outcome e of an

experiment to a function $X(t, e)$.

What is the law of the stochastic process? In mathematics, the law of a stochastic process is the measure that the process induces on the collection of functions from the index set into the state space.

What is the general theory of stochastic processes? Any collection of random variables $X = \{X_t : t \in T\}$ defined on (Ω, \mathcal{F}, P) is called a stochastic process with index set T . So, to every $t \in T$ corresponds some random variable $X_t : \Omega \rightarrow \mathbb{R}$, $\omega \mapsto X_t(\omega)$. Note that in the above definition we require that all random variables X_t are defined on the same probability space.

What is the difference between a random variable and a process? A random variable is a function $X(e)$ that maps the set of experiment outcomes to the set of numbers. A random process is a rule that maps every outcome e of an experiment to a function $X(t, e)$.

What is the difference between stochastic processes and probability? Probability is the study of randomness and uncertainty. The field of stochastic processes deals with randomness as it develops dynamically, and it can be thought of as the study of collections of related, uncertain events.

What is the difference between a random process and a deterministic process? A random process represents an ensemble of time functions, the value of which at any given time cannot be pre-determined or specified – thus a non-deterministic process. In contrast, a process is called deterministic if its value as a function of time can be pre-determined.

Is a stochastic process a collection of random variables? A stochastic process is the time evolution of a random variable or a collection of random variables. The range of all possible values is called the state space. Depending on the nature of a random variable, its state space may be continuous or discrete.

How old is Mathletics? Mathletics is an online educational website which launched in 2005.

What are the disadvantages of Mathletics? While the videos and interactives are great for self-directed learners, Mathletics doesn't replace the need for a classroom teacher. Kids can get stuck on a topic, answering questions incorrectly over and over again, without the program adapting or providing support (feedback is limited to correct or incorrect).
