The immune system protects us from infection through various lines of defence. If the immune system is not functioning as it should, it can result in disease, such as autoimmunity, allergy and cancer.

What is an example of immunology? Examples of such excessive immunologic responses that can be protective or cause disease include: 1) circulating antigen-antibody (immune) complexes of microbial antigens bound to IgM or IgG antibodies, 2) antibodies to microorganisms that cross-react with self-antigens, 3) vasoactive compounds from the complement ...

What is the difference between autoimmune and immunology? Your immune system is made up of organs and cells meant to protect your body from bacteria, parasites, viruses and cancer cells. An autoimmune disease is the result of the immune system accidentally attacking your body instead of protecting it. It's unclear why your immune system does this.

What falls under immunology? Immunology covers many areas of research, such as the production mechanisms of diverse antibodies, the formulation and maintenance of the T-cell repertoire, the development and maturation of lymphocytes, discrimination of self and non-self, and the interactions between immune cells and viruses or cancer cells (Fig.

What is the immunology test? The immunological tests used in laboratories are made by producing artificial antibodies that exactly match the substance or germ in
