**Comment définir la climatologie ?** La climatologie se conjugue à tous les temps : passé, futur, mais également présent. Vigie du temps et du climat, la climatologie entretient la mémoire du climat grâce aux longues séries de mesures, mesure l'évolution des paramètres (température, précipitations...) et dessine les tendances du changement climatique.

**Quelles sont les trois types de climat ?** Il existe 5 grands types de climat : le climat froid, le climat tempéré, le climat continental, le climat tropical et le climat désertique.

**Qui est le père de la Bioclimatologie ?** Synthèse entre les sciences physiques et biologiques, cette discipline - initiée au sein de l'Inra par Henri Geslin - contribue fortement à la compréhension des relations entre les écosystèmes cultivés ou naturels et le climat ; elle permet par conséquent l'amélioration des techniques agricoles avec notamment la ...

**Quel est le rôle d'un climatologue ?** En cas de catastrophe naturelle (inondation, tempête, tsunami, etc.), les climatologues se rendent sur le terrain afin d'étudier le

phénomène de plus près, de faire des relevés et des mesures. Ils cherchent ensuite à trouver une explication au phénomène et, surtout, les moyens de prévenir une récurrence.

**Quels sont les éléments de la climatologie ?** Les éléments pris en compte pour établir un climat sont les suivants : température, soleil, précipitations, humidité, vents et pression atmosphérique. Il existe plusieurs types de climats sur la planète qui répondent aux mêmes caractéristiques.

**Quel est l'objet d'étude de la climatologie ?** La climatologie est la science par laquelle on cherche à découvrir les régularités des phénomènes atmosphériques observés et à établir les lois qui les gouvernent – soit les répartitions géographiques et saisonnières des températures, des vents, des précipitations, etc.

**C'est quoi bioclimatique ?** Bâtiment dont l'implantation et la conception prennent en compte le climat et l'environnement immédiat, afin de réduire les besoins en énergie pour le chauffage, le refroidissement et l'éclairage.

**Quel est le rôle d'un climatologue ?** En cas de catastrophe naturelle (inondation, tempête, tsunami, etc.), les climatologues se rendent sur le terrain afin d'étudier le phénomène de plus près, de faire des relevés et des mesures. Ils cherchent ensuite à trouver une explication au phénomène et, surtout, les moyens de prévenir une récurrence.

**Quels sont les différences entre la météorologie et la climatologie ?** Le climat définit et explique les conditions de l'atmosphère au-dessus d'un lieu à moyen et long terme alors que la météorologie s'intéresse au court terme et notamment aux prévisions sur quelques jours. La climatologie étudie les composantes et les variations des climats sur la surface de la terre.

**Comment s'appelle la science qui étudie le climat ?** Du temps au climat Dès le début du xx<sup>e</sup> siècle, deux disciplines se sont clairement individualisées : la météorologie et la climatologie. C'est la durée des phénomènes analysés qui fait la différence entre ces deux disciplines : le temps qu'il fait se définit dans le court terme, le climat dans le long terme.
