## **SSPC-PA 2 Procedure for Determining Conformance to Dry**

### **Introduction**

The Steel Structures Painting Council (SSPC) has developed a comprehensive set of standards and procedures for surface preparation and coating application in the painting industry. SSPC-PA 2 is a specific procedure used to determine whether a surface is dry enough to accept a coating.

### **Procedure Overview**

SSPC-PA 2 involves placing a piece of calcium carbide paper (similar to a baby diaper) on the surface in question and monitoring the reaction. If the paper turns pink

or brownish within 5 minutes, the surface is considered wet and not yet dry enough for coating. If the paper remains white or only slightly discolored, the surface is considered dry.

## Frequently Asked Questions

**Q1: What is the purpose of calcium carbide paper?** A1: Calcium carbide reacts with moisture to produce a gas that turns the paper pink or brown.

**Q2: Why is it important to determine surface dryness before coating?** A2: Wet or damp surfaces can trap moisture under the coating, leading to adhesion problems, blistering, and premature failure.

**Q3: How long should the calcium carbide paper be left on the surface?** A3: 5 minutes is the recommended timeframe specified in SSPC-PA 2.

**Q4: What if the paper turns pink only on certain areas of the surface?** A4: This indicates that those areas are still wet and need additional drying time.

**Q5: What should be done if the surface is not dry after the recommended waiting period?** A5: Allow for more drying time or consider using alternative methods such as heat lamps or fans to accelerate evaporation.

## Conclusion

SSPC-PA 2 is a simple and reliable procedure for determining surface dryness before applying coatings. By following this procedure, painters can ensure that surfaces are properly prepared and minimize the risk of coating failures due to moisture entrapment.
