## Thermodynamics: An Engineering Approach 7th Edition SI Units Solution Manual

### Question:

Consider a closed system consisting of 1 kg of water initially at 25°C and 1 bar. The system is heated to 100°C at constant pressure. Determine the heat transfer, work done, and change in internal energy of the system.

### Answer:

**Heat transfer:**  $Q = m (h_2 - h_1) = 1 \text{ kg} (2676 \text{ kJ/kg} - 104.8 \text{ kJ/kg}) = 2571.2 \text{ kJ}$

**Work done:**  $W = 0$  (since the process occurs at constant pressure)

**Change in internal energy:**  $\Delta U = Q - W = 2571.2 \text{ kJ}$

### Question:

A heat engine operates between two reservoirs at 1000 K and 300 K. The heat transfer into the engine from the high-temperature reservoir is 1000 kJ. Determine

the maximum thermal efficiency of the engine and the work done during the cycle.

**Answer:**

**Maximum thermal efficiency:**  $\eta_{\max} = (1 - T_2/T_1) = (1 - 300 \text{ K} / 1000 \text{ K}) = 0.7$

**Work done:**  $W = \eta_{\max} Q = 0.7 \cdot 1000 \text{ kJ} = 700 \text{ kJ}$

**Question:**

A Carnot refrigerator operates between a cold reservoir at  $-10^\circ\text{C}$  and a warm reservoir at  $25^\circ\text{C}$ . The refrigerator extracts 1000 kJ of heat from the cold reservoir. Determine the heat transfer to the warm reservoir and the work input required.

**Answer:**

**Heat transfer to the warm reservoir:**  $Q_w = Q_c (T_2/T_1) = 1000 \text{ kJ} (298 \text{ K} / 263 \text{ K}) = 1133.1 \text{ kJ}$

**Work input:**  $W = Q_c (1 - T_1/T_2) = 1000 \text{ kJ} (1 - 263 \text{ K} / 298 \text{ K}) = 116.9 \text{ kJ}$

**Question:**

A gas turbine operates at a steady state with air entering the compressor at 1 bar and  $25^\circ\text{C}$ . The air is compressed to 6 bar and  $300^\circ\text{C}$ . It then enters the combustion chamber, where fuel is burned, raising the temperature to  $1000^\circ\text{C}$ . The air then expands through the turbine, producing work and exiting at 1 bar and  $450^\circ\text{C}$ .

**Answer:**

**Work done by the compressor:**  $W_c = m \cdot (h_2 - h_1)$  (approximately)

**Heat added in the combustion chamber:**  $Q_c = m \cdot (h_3 - h_2)$

**Work done by the turbine:**  $W_t = m \cdot (h_4 - h_3)$

**Net work output:**  $W_{\text{net}} = W_t - W_c$

**Question:**

A steam boiler operates at a steady state, with feed water entering at 100 kPa and 25°C. The water is heated to 500 kPa and 150°C in the boiler. The fuel used for heating the water has a lower heating value of 44 kJ/g. Determine the minimum amount of fuel required to power the boiler for 1 hour, assuming no losses.

**Answer:**

**Mass flow rate of water:**  $m = Q / (h_2 - h_1)$

**Rate of fuel consumption:**  $m_f = m * LHV / ?$

**Minimum amount of fuel required:**  $m_f * 1 \text{ hour}$
