Trigonometry for Success: Questions and Answers with Larson 9th Edition

Question 1: Can you explain the unit circle and its relationship to radian measure? Answer: The unit circle is a circle with radius 1 and center at the origin of the coordinate plane. Radian measure is an angle measure based on the unit circle. An angle of 1 radian is defined as the angle that intercepts an arc of length 1 on the unit circle.

Question 2: How do you find the trigonometric ratios of an angle in quadrant II? Answer: In quadrant II, the sine and cosine functions are both negative. To find the other trigonometric ratios, use the following identities:

- $\tan \theta = -\sin \theta / \cos \theta$
- $\csc \theta = -1 / \sin \theta$
- $\sec \theta = -1 / \cos \theta$
- $\cot \theta = -\cos \theta / \sin \theta$

Question 3: Can you solve a right triangle using the Pythagorean theorem and trigonometric ratios? Answer: Yes, to solve a right triangle, you can use the Pythagorean theorem ($a^2 + b^2 = c^2$) to find the missing side length. You can also use trigonometric ratios to find the angles and other side lengths. For example, if you know the length of two sides, you can use the tangent ratio to find the angle opposite the smaller side.

Question 4: How do you prove trigonometric identities? Answer: Trigonometric identities are equalities that hold true for all values of the variables involved. To prove an identity, you can use various methods, such as algebraic manipulation, Pythagorean identities, and the unit circle. For example, to prove the identity $\sin^2 \theta + \cos^2 \theta = 1$, you can use the Pythagorean identity $\sin^2 \theta + \cos^2 \theta = 1$.

Question 5: Can you apply trigonometry to real-world problems? Answer: Yes, trigonometry has many real-world applications. For example, it is used in navigation, surveying, astronomy, and engineering. In navigation, trigonometry is used to calculate the distance between two points. In surveying, it is used to determine the height of buildings and other structures. In astronomy, it is used to calculate the positions and distances of celestial objects.
