use these tools to diagnose and resolve issues effectively.

Question 1: How can I debug call failures using the CTCollab Health Check?

Answer: The Health Check tool provides a real-time view of call status and allows you to identify failed calls and their associated error messages. To use it, navigate to the "Health Check" tab within the CTCollab dashboard and filter by "Call Failures."

Question 2: Which tool allows me to monitor call quality and identify potential issues?

Answer: The Media Quality Manager (MQM) tool monitors call statistics such as jitter, packet loss, and latency. By analyzing these metrics, you can pinpoint areas where call quality is affected and take appropriate corrective actions.

Question 3: How can I diagnose issues related to endpoints?

Answer: The Endpoint Management module within CTCollab provides a comprehensive overview of all endpoints. Use it to identify endpoints that are offline, have configuration errors, or are experiencing performance issues.

Question 4: What is the role of the Cisco Unified Service Traceroute (UST) tool?

Answer: UST is a diagnostic tool that allows you to trace call paths and identify network issues that may be affecting call quality. It can pinpoint network congestion, dropped packets, and other problems along the call path.

Question 5: How can I use the Syslog Server within CTCollab to monitor system events?

Answer: The Syslog Server collects and stores system logs from Cisco IP telephony and video devices. By analyzing these logs, you can identify error messages, performance issues, and other events that may require attention.
