Teaching Transparency Worksheet: The pH Scale

Question 1: What is the pH scale?

Answer: The pH scale is a measure of the acidity or alkalinity of a solution. It ranges from 0 to 14, with 0 being the most acidic and 14 being the most alkaline (or basic).

A pH of 7 is neutral.

Question 2: How is the pH scale used?

Answer: The pH scale is used in various applications, including:

- Measuring the acidity or alkalinity of water, soil, and food
- Assessing the health of plants and animals
- Controlling chemical reactions in industrial processes
- Calibrating pH meters

Question 3: What are the different pH ranges?

Answer: The pH scale can be divided into three main ranges:

- **Acidic:** pH below 7 (e.g., lemon juice, vinegar)
- **Neutral:** pH equal to 7 (e.g., pure water)
- **Alkaline (Basic):** pH above 7 (e.g., soap, baking soda)

Question 4: How do you calculate pH?

Answer: pH can be calculated using the formula:

$$\text{pH} = -\log[\text{H}^+],$$

where $[\text{H}^+]$ is the concentration of hydrogen ions in moles per liter.

Question 5: What are the limitations of the pH scale?

Answer: The pH scale has some limitations, such as:

- It only measures the concentration of hydrogen ions, not other types of ions.
- It does not provide information about the specific chemical composition of a solution.
- It can be affected by temperature and the presence of certain substances.
