Download Complete File

What is cell question and answer? Cell is the smallest unit of life. They are the structural, functional and biological units of life. The discovery of cells was first made by Robert Hooke. While examining a section of a cork under the microscope, he observed small compartment-like structures and named them cells.

What are some common questions about cells?

How do I study for a cell biology test?

What is the cell test? Cell test/s/ing may mean: Biology. Cell culture assays. Biopsy test, testing cells from a biopsy. Sickle cell test, the test for sickle cell anemia.

What is the biggest cell in the human body? Ovum (female gamete) is the largest cell present in the human body. It is a single cell released from the ovary every month. The size of each ovum is 0.1mm in diameter. The smallest cell in the human body is the sperm (male gamete).

What is the smallest cell in the human body? Answer: The sperm cell is the smallest cell in the human body. The volume of these cells is quite tiny. The head of a sperm cell is roughly 4 micrometres long, about the same size as a red blood cell (RBCs). Egg cells are the biggest cells in the human body (ovum).

Do all cells have the same DNA? All of the cells within a complex multicellular organism such as a human being contain the same DNA; however, the body of such an organism is clearly composed of many different types of cells. What, then, makes a liver cell different from a skin or muscle cell? The answer lies in the way each cell

deploys its genome.

Do all cells have a nucleus? Cells are divided into two main classes, initially defined by whether they contain a nucleus. Prokaryotic cells (bacteria) lack a nuclear envelope; eukaryotic cells have a nucleus in which the genetic material is separated from the cytoplasm.

How many cells are in our body? According to a new analysis of more than 1,500 papers, the average adult male human has around 36 trillion cells — that's 36 followed by 12 zeros — while adult females have 28 trillion and 10-year-old children have about 17 trillion.

What is a cell simple answer? Cells are the basic building blocks of all living things. The human body is composed of trillions of cells. They provide structure for the body, take in nutrients from food, convert those nutrients into energy, and carry out specialized functions.

What is cell theory question answer? The cell theory was proposed by two scientists- Schleiden (1838) and Schwann (1839). It says that all the plants and animals are composed of cells and the cell is the basic unit of life. The cell theory was further expanded by Virchow (1855) by suggesting that all cells arise from pre-existing cells.

What is a cell computer answer? Explanation: A cell is a specific location within a spreadsheet and is defined by the intersection of a row and column. Since most spreadsheets use numbers to define rows and letters to define columns, cells are often referenced by a letter and number combination .

What is the define of a cell? A cell is a mass of cytoplasm that is bound externally by a cell membrane. Usually microscopic in size, cells are the smallest structural units of living matter and compose all living things. Most cells have one or more nuclei and other organelles that carry out a variety of tasks.
