**What are the molecular markers used in plant biotechnology?** These DNA based markers are differentiated in two types first non PCR based (RFLP) and second is PCR based markers (RAPD, AFLP, SSR, SNP etc.), amongst others, the microsatellite DNA marker has been the most widely used, due to its easy use by simple PCR, followed by a denaturing gel electrophoresis for allele size ...

**What is plant molecular biology and biotechnology?** In Molecular Plant Biology we study how plants function at the cellular level and how cellular mechanisms evolved. Work in these areas is crucial to: Understanding the regulation of photosynthesis, plant metabolism and other underlying plant growth mechanisms.

**What is the importance of molecular marker in biotechnology?** Molecular markers can be used to identify multiple different regions of chromosomes that contain genes that act together to produce complex traits. This process involves finding combinations of alleles of molecular markers that are correlated with a quantitative phenotype such as body mass, height, or intelligence.

**What are the application of molecular markers in plants?** They are used in the study of phylogenetic relationships, selection of superior plants, and the study of similarities or differences between different specimens. Molecular markers are also used in germplasm management and marker-assisted selection (MAS) to increase the efficiency of germplasm breeding.

**What is the role of molecular markers in transgenic plants?** Molecular markers are specific fragments of DNA that can be identified within the whole genome. Molecular markers are found at specific locations of the genome. They are used to 'flag' the position of a particular gene or the inheritance of a particular character.

**What is an example of a marker in biotechnology?** Morphological, cytological and biochemical markers are types of classical markers and some examples of DNA markers are restriction fragment length polymorphism (RFLP), amplified fragment length polymorphism (AFLP), simple sequence repeats (SSRs), single-nucleotide polymorphism (SNP) and diversity arrays technology ( ...

**What is plant biotechnology used for?** Plant biotechnology is a part of our daily lives in applications such as developing nutritionally enhanced foods, enabling sustainable agricultural production, and engineering plants for industrial and medical purposes.

**What is the difference between biotechnology and molecular biotechnology?** What is the study of molecular biology and biotechnology? Molecular biology is the study of microorganisms and the effects they have on people's lives. Biotechnology uses this knowledge to develop technologies and processes that alleviate global issues like disease, energy and crop yields.

**What are the examples of molecular biotechnology?** Synthetic insulin and synthetic growth hormone and diagnostic tests to detect various diseases are just

some examples of how biotechnology is impacting medicine. Biotechnology has also proved helpful in refining industrial processes, in environmental cleanup, and in agricultural production.

**What are the three molecular markers?** Because normal DNA or protein molecules are used to score the genetic material, molecular markers are phenotypically neutral. This is a significant advantage compared to traditional phenotypic markers. The three most common types of markers used today are RFLP, RAPD and isozymes.

**What are the two types of molecular markers?** In the detection of molecular markers by gel electrophoresis, co-dominant markers are observed on the gel as DNA bands of many different alleles whereas a dominant marker only has two alleles represented as present or absent of bands.

**What are the disadvantages of molecular markers?** Using molecular markers can require the use of specific laboratory equipment, such as a PCR (polymerase chain reaction) thermalcycler and electrophoresis and visualization equipment.

**What is the role of molecular markers in plant taxonomy?** Among the various methods available for estimating genetic diversity among plant species, DNA molecular markers are a powerful tool for assessing genetic diversity and relationships.

**What are the benefits of molecular markers?** Molecular markers have three-fold applications in gene mapping: (1) A marker allows the direct identification of the gene of interest instead of the gene product, and consequently, it serves as a useful tool for screening somatic cell hybrids; (2) Use in several DNA probes and easy-to-screen techniques, a marker also ...

**What are molecular markers in plant genome analysis?** These DNA based markers are differentiated in two types first hybridization based (RFLP) and second is PCR based markers (RAPD, AFLP, SSR, SNP, EST etc.), amongst others, the microsatellite DNA marker has been the most widely used, due to its easy use by simple PCR, followed by a denaturing gel electrophoresis for ...

**What is RFLP in plant biotechnology?** Restriction Fragment Length Polymorphism (RFLP) Such variation results in different sized (or length) DNA fragments produced by digesting the DNA with a restriction enzyme. RFLPs can be used as genetic markers, which are often used to follow the inheritance of DNA through families.

**What are molecular markers in seed technology?** Due to their stability, reliability, and abundance, molecular markers can be employed for seed purity-related issues such as (1) determining the genetic identity of a variety or parental lines and verifying if the variety offered for sale is the same or not; (2) testing purity of elite varieties/inbred lines, GM/non-GM ...

**What are the most commonly used molecular markers?** The three most common types of markers used today are RFLP, RAPD and isozymes. Of the three marker types, RFLPs have been used the most extensively.

**What is a molecular marker in plant taxonomy?** Molecular genetic markers can be used as a supplementary marker system which will increase resolution in taxonomic research. The molecular evolution among taxa is highly variable and the extent of divergence in DNA or genes can be taken as the basis for differentiation among species.
