How do I network 5 computers together?

How to computer networking step by step? Plug one end of an Ethernet cable into the "Internet" port on the back of the modem, then connect the other end of the cable to the "Internet" or "Ethernet" port on your Internet source. You'll also need to plug in the Internet source's power cable before proceeding.

What is a hub in a computer network? In networking, a hub is a device that links multiple computers and devices together. Hubs can also be referred to as repeaters or concentrators, and they serve as the center of a local area network (LAN). In a hub, each connected device is on the same subnet and receives all data sent to the hub.

What is topology in a computer network? A network topology is the physical and logical arrangement of nodes and connections in a network. Nodes usually include devices such as switches, routers and software with switch and router features. Network topologies are often represented as a graph.

How many computers can share one Wi-Fi network? In real life, how many users can a wireless router connect at most? According to router manufacturers, the average home router can connect about 10-40 wireless devices at the same time, which not only depends on the processing power of the router, but also on the bandwidth size.
