**What is the diagnostic method of congenital heart disease?** Congenital heart disease may initially be suspected during a routine ultrasound scan of the baby in the womb. Specialist ultrasound, called foetal echocardiography, will then be carried out at around 18 to 22 weeks of the pregnancy to try to confirm the exact diagnosis.

**What is the congenital heart disease advocacy group?** The Adult Congenital Heart Association is a national organization providing education and support services for adults with congenital heart defects and their families. They are focused on the long-term needs of adults with congenital heart defects and providing education, outreach, and advocacy.

**Which diagnostic study would be used to assess congenital heart disease?** A cardiac MRI may be done to diagnose and evaluate congenital heart defects in adolescents and adults. A heart MRI creates 3D pictures of the heart, which allows for accurate measurement of the heart chambers.

**What is the diagnosis code for congenital heart disease?** Congenital malformation of heart, unspecified Q24. 9 is a billable/specific ICD-10-CM code that can be used to indicate a diagnosis for reimbursement purposes.

**How long can you live with congenital heart disease?** Among our patients with ACHD alive at 18 years of age, >75% were still alive after 50 years of follow-up, with about 50% of patients with complex ACHD, conotruncal, or severe nonconotruncal defects still alive at 68 years of age.

**Is congenital heart disease a disability?** Children age 12 and older should be considered disabled if they have congenital heart disease documented by appropriate medically acceptable imaging or cardiac catheterization, with one of the following criteria: A.

**What is the most congenital heart disease?** Tetralogy of Fallot is the most common complex congenital heart disorder and is a combination of four defects: Pulmonary stenosis. A large ventricular septal defect.

**Which genetic disorder is most associated with congenital heart disease?** Trisomy 21 (Down syndrome) It can be diagnosed with genetic testing before birth. How it affects the heart: About half of children with Down syndrome are born with a congenital heart defect such as a septal defect (hole in the heart).

**What is life like with congenital heart disease?** Congenital heart disease requires lifelong care. Heart conditions can worsen later in life, even if they weren't severe enough to treat in childhood. Childhood treatments can lose their effectiveness. CHD can impact other areas of your life and health, including pregnancy, liver and kidney disease, and mental health.

**How is congenital heart disease treated in adults?** Some adults with congenital heart disease may need a medical device or heart surgery. Implantable heart devices. A pacemaker or an implantable cardioverter-defibrillator (ICD) may be needed.

**What is the gold standard test for congenital heart disease?** Echocardiogram. An echocardiogram is an ultrasound movie of the inside of the heart. It can detect nearly every congenital heart defect or any problem of the heart muscle function. The test is often performed by a specialized technician called a sonographer, or by a physician.

**What are the four stages of congestive heart failure?** Heart failure can progress, so researchers have identified four stages of the disease — A, B, C and D. Health care professionals also classify heart failure when it has progressed to stages C and D. This classification measures a patient's overall heart function and severity of symptoms.

**What is the diagnosis of congenital heart disease?** Tests that can help diagnose CHD in newborns, children or adults include: Physical exam: During an exam, a healthcare provider will listen to your heart for any abnormal sounds. Chest X-ray: A chest X-ray takes pictures of the inside of your chest to reveal any structural abnormalities.

**What is Q20.8 congenital heart disease?** 2024 ICD-10-CM Diagnosis Code Q20.8: Other congenital malformations of cardiac chambers and connections.

**When should CCHD screening be done?** Infants will receive a pulse oximetry screening after 24 hours of age or before discharge from the hospital. This includes neonatal intensive care unit (NICU) infants who are stable and preparing for discharge.

**What diagnostic tool is congenital heart disease?** Echocardiogram. An echocardiogram is an ultrasound movie of the inside of the heart. It can detect nearly every congenital heart defect or any problem of the heart muscle function. The test is often performed by a specialized technician called a sonographer, or by a physician.

**What are the diagnostic tests for congenital disorders?** Detecting Abnormalities Before Birth. Chorionic villus sampling and amniocentesis are used to detect abnormalities in a fetus. During both procedures, ultrasonography is used for guidance. In chorionic villus sampling, a sample of chorionic villi (part of the placenta) is removed by one of two methods.

**What is the diagnostic test for CHD?** To check for low blood flow to your heart muscle, your provider will use an ECG, echocardiogram, or another imaging test to monitor you while you exercise. Cardiac magnetic resonance imaging (MRI) detects tissue damage or problems with blood flow in the heart or coronary arteries.

**What diagnostic imaging for congenital heart disease?** Although echocardiography and catheter-directed cardiac angiography are generally accepted as the primary imaging techniques for evaluation of CHD, CT and MRI are important complementary diagnostic tools.

### **Solutions, Molarity, and Dilution Practice: Answer Key**

**Question 1:** A solution is prepared by dissolving 0.5 moles of NaCl in 1 liter of water. What is the molarity of the solution?

**Answer:** Molarity = Moles of solute / Liters of solution  
 $\text{Molarity} = 0.5 \text{ moles} / 1 \text{ liter} = 0.5 \text{ M}$

**Question 2:** A 10 M solution of NaOH is diluted by adding 2 liters of water. What is the new molarity of the solution?

**Answer:**  $M_1V_1 = M_2V_2$   
 $10 \text{ M} \times 1 \text{ liter} = M_2 \times 3 \text{ liters}$   
 $M_2 = 10 \text{ M} / 3 \text{ liters} = 3.33 \text{ M}$

**Question 3:** How many moles of glucose are present in 2 liters of a 0.1 M solution?

**Answer:** Molarity = Moles of solute / Liters of solution  
 $0.1 \text{ M} = \text{Moles of glucose} / 2 \text{ liters}$   
 $\text{Moles of glucose} = 0.1 \text{ M} \times 2 \text{ liters} = 0.2 \text{ moles}$

**Question 4:** A stock solution of HCl with a concentration of 12 M is used to prepare a 2 M solution. If 50 mL of the stock solution is used, how much water must be added?

**Answer:**  $M_1V_1 = M_2V_2$   $12\text{ M} \times 50\text{ mL} = 2\text{ M} \times V_2$   $V_2 = (12\text{ M} \times 50\text{ mL}) / 2\text{ M} = 300\text{ mL}$

**Question 5:** A 150 mL sample of a solution contains 0.02 moles of NaCl. What is the molarity of the solution?

**Answer:** Molarity = Moles of solute / Liters of solution Molarity =  $0.02\text{ moles} / (150\text{ mL} / 1000\text{ mL/L}) = 0.13\text{ M}$
