The Frog: An Introduction to Anatomy, Histology, and Embryology

Q1: Describe the external anatomy of a frog. A1: Frogs have a distinct body plan characterized by a dorsoventrally flattened head and body, paired forelimbs and hindlimbs, and a lack of a tail. The skin is moist and glandular, and the eyes protrude slightly from the head.

Q2: What are the major structures of the frog's digestive system? A2: The digestive system consists of the oral cavity, esophagus, stomach, small intestine, large intestine, and cloaca. The mouth has teeth adapted for grasping prey, while the stomach performs digestion aided by gastric glands. The small intestine is responsible for nutrient absorption, while the large intestine absorbs water and electrolytes.

Q3: Describe the histology of the frog's skin. A3: The skin of a frog is composed of a multi-layered epidermis and a dermis. The epidermis contains keratinized cells and mucous glands, providing protection and hydration. The dermis contains blood vessels, connective tissue, and lymphoid tissue.

Q4: Explain the stages of frog embryology. A4: Frog embryology begins with fertilization of an egg, which develops into a blastula. Gastrulation leads to the formation of three germ layers: ectoderm, mesoderm, and endoderm. Neurulation results in the development of the nervous system, followed by organogenesis, where the major organs are formed.

Q5: What are the functions of the frog's circulatory system? A5: The circulatory system consists of a heart, blood vessels, and blood. The heart pumps blood through the arteries, which carry oxygenated blood to all parts of the body. Deoxygenated blood returns to the heart through the veins. The lymphatic system, consisting of lymph nodes and vessels, plays a role in fluid balance and immune responses.
