Some Properties of Electric Circuits Lab Answers

Question 1: What is the difference between a series circuit and a parallel circuit?

Answer: In a series circuit, the components are connected one after another, so the current flows through each component in turn. In a parallel circuit, the components are connected in separate branches, so the current can flow through any combination of components.

Question 2: What is Ohm's Law?

Answer: Ohm's Law states that the current (I) flowing through a conductor is directly proportional to the voltage (V) applied across it and inversely proportional to its resistance (R). $I = V/R$

Question 3: What is the power dissipated in a resistor?

Answer: The power dissipated in a resistor is given by $P = VI$, where P is the power, V is the voltage across the resistor, and I is the current flowing through it.

Question 4: What is the relationship between voltage, current, and resistance in a parallel circuit?

Answer: In a parallel circuit, the total current is equal to the sum of the currents through each branch. The voltage across each branch is the same. The total

resistance is given by the formula $1/R_T = 1/R_1 + 1/R_2 + 1/R_3 + \dots$

Question 5: How can you measure the resistance of a component using a multimeter?

Answer: To measure the resistance of a component using a multimeter, set the multimeter to the ohms setting. Connect the positive lead of the multimeter to one end of the component and the negative lead to the other end. The multimeter will display the resistance of the component in ohms.
