Question: What is the purpose of a solubility temperature graph?

Answer: A solubility temperature graph shows the relationship between the temperature of a solvent and the amount of solute that can dissolve in it.

Paragraph 2:

Question: How do you interpret a solubility temperature graph?

Answer: The x-axis of the graph represents the temperature, and the y-axis represents the solubility. The solubility curve shows the maximum amount of solute that can dissolve at a given temperature.

Paragraph 3:

Question: What is the solubility of a solute at 50°C if the solubility temperature graph shows a solubility of 60 g/100 g of water at 60°C?

Answer: To determine the solubility at 50°C, find the temperature on the x-axis that corresponds to 50°C and then read the corresponding value on the y-axis. In this case, the solubility is approximately 45 g/100 g of water.

Paragraph 4:

Question: What is the effect of temperature on solubility?

Answer: Generally, the solubility of solids in liquids increases with increasing temperature, while the solubility of gases in liquids decreases with increasing temperature.

Paragraph 5:

Question: What is a saturated solution?

Answer: A saturated solution is a solution in which no more solute can dissolve at a given temperature. The solubility temperature graph shows the maximum solubility for each temperature, so any point on the curve represents a saturated solution.
