Skill Practice 35: Gas Law Practice

Question 1: A sample of gas occupies a volume of 2.5 L at a pressure of 1.2 atm. If the pressure is increased to 2.4 atm, what will be the new volume of the gas?

Answer: 1.25 L

Explanation: According to Boyle's Law, $P_1V_1 = P_2V_2$, where P_1 is the initial pressure, V_1 is the initial volume, P_2 is the final pressure, and V_2 is the final volume.

Question 2: A cylinder contains 0.5 moles of oxygen at a temperature of 298 K. If the volume of the cylinder is doubled, what will be the new temperature of the gas?

Answer: 596 K

Explanation: According to Charles' Law, $V_1/T_1 = V_2/T_2$, where V_1 is the initial volume, T_1 is the initial temperature, V_2 is the final volume, and T_2 is the final temperature.

Question 3: A mixture of gases contains 2 moles of nitrogen and 3 moles of hydrogen. If the total pressure of the mixture is 4 atm, what is the partial pressure of nitrogen?

Answer: 2.4 atm

Explanation: According to Dalton's Law, the total pressure of a mixture of gases is equal to the sum of the partial pressures of the individual gases. Therefore, the partial pressure of nitrogen is (2 moles N₂ / 5 moles total) * 4 atm = 2.4 atm.

Question 4: A container of gas has a volume of 5.0 L at a temperature of 273 K. If the gas is cooled to 137 K, what will be the new pressure of the gas?

Answer: 1.0 atm

Explanation: According to Gay-Lussac's Law, $P_1/T_1 = P_2/T_2$, where P_1 is the initial pressure, T_1 is the initial temperature, P_2 is the final pressure, and T_2 is the final temperature.

Question 5: A sample of helium gas has a density of 0.178 g/L at a pressure of 1.0 atm. What is the molar mass of helium?

Answer: 4.0 g/mol

Explanation: The density of a gas is given by (Molar mass / Volume) *Pressure*. Solving for molar mass, we get *Molar mass = Density Volume / Pressure*. Plugging in the given values, we get 0.178 g/L * 5 L / 1.0 atm = 0.89 g. Therefore, the molar

mass of helium is 4.0 g/mol.
