Each orbital can only hold two electrons.

Why are 2,8,18,32 a magic number? The numbers 2, 8, 8, 18, 18, 32 are known as magic numbers. It is because of the fact that the elements which occur after these

intervals have similar properties. For example, atomic number of Li is 3. If we add 8 (magic number) to 3, then we will get atomic number 11 which stands for sodium.

What is the 1.7 rule in chemistry? The degree to which an atom attracts electrons in a chemical bond is described by electronegativity. If the difference in electronegativity is greater than 1.7, the character of the bond will be ionic. If the difference in electronegativity is between 0.4 and 1.7, the character of the bond is polar covalent.

What is the n+l rule? The (n+l) rule, also known as the Aufbau principle or Aufbau sequence, determines the energy of all atomic orbitals. The rule says that the orbital having a lower value of (n+l) is filled first. If two orbitals have the same n+l, the one with lower n is filled first. The first orbital we fill in is the 1s orbital.

What is the Madelung's rule? The Madelung rule tries to establish the order in which electrons fill energy sublevels of atoms. The aufbau principle says that in the ground state of an atom, electrons always occupy the lowest available energy sublevel. The Madelung rule, summarized in the diagram below, shows the order electrons add to sublevels.
