**What part of the brain controls memory and consciousness?** Neuroscientists believe that, in humans and mammals, the cerebral cortex is the "seat of consciousness," while the midbrain reticular formation and certain thalamic nuclei may provide gating and other necessary functions of the cortex (12).

**Does consciousness stem from the brain?** Consciousness likely comes down to electrochemical functions in the brain, she says. "It's hard for psychological reasons." Cynthia McCormick Hibbert is a Northeastern Global News reporter.

**Where is trauma stored in the brain?** The amygdala stores the visual images of trauma as sensory fragments, which means the trauma memory is not stored like a story, rather by how our five senses were experiencing the trauma at the time it was occurring. The memories are stored through fragments of visual images, smells, sounds, tastes, or touch.

**What does the back of your brain control?** Cerebellum. The cerebellum is located at the back of the brain beneath the occipital lobes. It is separated from the cerebrum by the tentorium (fold of dura). The cerebellum fine tunes motor activity or movement, e.g. the fine movements of fingers as they perform surgery or paint a picture.

**Is consciousness a brain process or soul?** Consciousness is a quality of the soul. The soul is spiritual and is located in the region of the heart of living creatures. It is a different substance to matter which is what the body is made of. The soul is eternal, always alive and full of knowledge and bliss.

**Can your consciousness connect to the universe?** Your very own consciousness can interact with the universe. A recent experiment suggests the brain is not too warm or wet for consciousness to exist as a quantum wave that connects with the universe.

**Can there be consciousness without a brain?** If the brain is impaired, thoughts will be affected, but the consciousness that knows the thought remains the same. Consciousness is independent of the condition of the body and mind.

**How do you know your body is releasing trauma?** Issues like stomach cramps, diarrhea, constipation, or other digestive problems can manifest when the body begins to process and let go of trauma. These symptoms reflect the body's attempt to expel stress and restore balance.

**Where are bad memories stored in the brain?** Traumatic memories get stuck in the emotional memory of the amygdala rather than reaching the hippocampus, the area of the brain that records the details – like the what, when and where of an event. So for survivors the “memory” of a trauma often emerges as a strong emotional or sensory experience.

**How trauma destroys the brain?** When a person is experiencing a traumatic event or experiencing extreme fear, their "Fear Circuitry" may kick in and the prefrontal cortex begins to function less effectively. This means that in the midst of trauma, a person may not be able to think through the situation and make decisions such as calling for help.

**What part of the brain keeps you alert?** Your thalamus plays a role in keeping you awake and alert. Role in thinking (cognition) and memory. Your thalamus is connected with structures of your limbic system, which is involved in processing and regulating emotions, formation and storage of memories, sexual arousal and learning.

**What part of the brain controls smell?** Sensory neurons in the nose detect odor molecules and relay signals to the olfactory bulb, a structure in the forebrain where initial odor processing occurs. The olfactory bulb primarily transmits information to the piriform cortex, the main structure of the olfactory cortex, for more comprehensive processing.

**What protects the brain?** The brain is protected by the bones of the skull and by a covering of three thin membranes called meninges. The brain is also cushioned and protected by cerebrospinal fluid. This watery fluid is produced by special cells in the four hollow spaces in the brain, called ventricles.

**What brain function is responsible for consciousness?** Reticular Network This formation and some neurons in the thalamus, together with others from various sensory systems of the brain, make up the reticular activating system—the means by which we maintain consciousness.

**Which part of the brain is primarily responsible for thought memory and consciousness?** Collectively, your cerebral cortex is responsible for the higher-level processes of the human brain, including language, memory, reasoning, thought, learning, decision-making, emotion, intelligence and personality.

**What controls consciousness memory and emotions?** The limbic system is a group of structures in your brain that regulate your emotions, behavior, motivation and memory. While small in size, your limbic system has a big job to help you interact with the world around you.

**What part of the brain controls working memory?** Pioneering studies in the 70s and 80s traced the neural underpinnings of working memory to the brain's prefrontal cortex. There, neurons appear to preserve information by collectively firing for seconds to minutes, much longer than the millisecond norm for individual neurons.
