Set Theory Problems and Solutions

Introduction Set theory is a fundamental branch of mathematics that deals with the study of sets, which are collections of distinct elements. Understanding set theory is crucial for various branches of mathematics, including algebra, analysis, and topology. In this article, we explore some common set theory problems and provide step-by-step solutions.

Problem 1: Find the union of the sets $A = \{1, 2, 3\}$ and $B = \{2, 3, 4\}$.

Solution: The union of two sets, denoted as $A \cup B$, is a new set that contains all the elements that are present in either A or B. Therefore, $A \cup B = \{1, 2, 3, 4\}$.

Problem 2: Determine whether the set $C = \{x \mid x \text{ is an even number}\}$ is a subset of the set $D = \{x \mid x \text{ is an integer}\}$.

Solution: A set C is a subset of a set D if every element of C is also an element of D. Since every even number is also an integer, C is a subset of D.

Problem 3: Prove that the set $E = \{x \mid x^2 < 4\}$ is an empty set.

Solution: An empty set is a set that contains no elements. Since $x^2 < 4$ only holds for $x = -2$ and $x = 2$, and neither of these values are in the set E, E is an empty set.

Problem 4: Find the power set of the set $F = \{a, b\}$.

Solution: The power set of a set A, denoted as $P(A)$, is the set of all subsets of A. Therefore, $P(F) = \{\{\}, \{a\}, \{b\}, \{a, b\}\}$.

Problem 5: Determine the complement of the set $G = \{x \mid x \text{ is a rational number less than } 1\}$ in the universe of all rational numbers.

Solution: The complement of a set A in a universe U, denoted as A' , is the set of all elements in U that are not in A. Therefore, $G' = \{x \mid x \text{ is a rational number greater than or equal to } 1\}$.
