How to convert global to local coordinates? Once the world matrix is converted, multiplying it by the coordinates of a world-space point will yield a point in the local space of the rigid body. Any number of points can be multiplied by this inverted matrix to transform them from world (API) coordinates to local (rigid body) coordinates.

What is the conversion between coordinate systems? The procedure for converting from one coordinate system to another is known as coordinate transformation. The procedure requires that some points have their coordinates known (or measured) in both the arbitrary and the final coordinate systems. Such points are called control points.

To convert a point from spherical coordinates to cylindrical coordinates, use equations $r = \rho \sin \theta$, $\phi = \theta$, and $z = \rho \cos \theta$.

What are the three types of coordinate systems? There are three commonly used coordinate systems: Cartesian, cylindrical and spherical. In this chapter, we will describe a Cartesian coordinate system and a cylindrical coordinate system.
