What is the introduction of plant disease? Plant disease is defined as the state of local or systemic abnormal physiological functioning of a plant, resulting from the continuous, prolonged 'irritation' caused by phytopathogenic organisms (infectious or biotic disease agents).

Why do plants get sick? Nutrient deficiencies, excess heat, herbicide damage, flooding, and drought can also impair plant growth and cause similar symptoms to those caused by pathogens.

What are the main causes of plant diseases? Infectious plant diseases are mainly caused by pathogenic organisms such as fungi, bacteria, viruses, protozoa, as well as insects and parasitic plants [1].

How are diseases spread from plant to plant? Transmission and infection Most foliage invaders are spread from plant to plant by windblown rain or dust. Humans disseminate bacteria through cultivation, grafting, pruning, and transporting diseased plant material. Animals, including insects and mites, are other common transmission agents.

What is the most common disease in plants?

What are the three basic symptoms of plant disease? We often recognize these problems based on the symptoms that result. A symptom is a change in plant growth or appearance that may indicate or describe a plant health problem. Examples of symptoms include yellowing, wilting, dieback, galls or blight.

Imagine if a human didn't have a brain; they could get cut, but they wouldn't know and there wouldn't be anything to tell that they are in pain...so technically they would not be in pain. Same for plants.

What is the most responsible factor for plant diseases? Fungi and Fungal-like Organisms (FLOs) Collectively, fungi and FLOs cause the most plant disease than any other group of plant pathogens. These organisms cannot make their own food,

Chemicals used to control bacteria (bactericides), fungi (fungicides), and nematodes (nematicides) may be applied to seeds, foliage, flowers, fruit, or soil.

How to identify sick plants? There are a variety of symptoms of plant disease such as spots, dead or dying tissue, fuzzy spores, bumps, bulges, and irregular coloration on the fruits. How do you diagnose plant diseases? Start by examining affected parts with a dissecting scope and move to a compound light microscope, if necessary. Look for fruiting structures (signs of the disease agent) or evidence of insects or insect activity. Leaves/Stems: IF leaf spots, lesions or cankers, look for fungal growth.
