High-Yield MCAT Physics Practice Questions with Detailed Explanations

For students preparing for the MCATs, the physics section can be a daunting task. To help you maximize your score, Sterling Test Prep has compiled a set of high-yield practice questions with detailed explanations. These questions cover the most commonly tested topics and concepts, giving you valuable insights into what to expect on the actual exam.

Question 1:

A 10 kg object is dropped from a height of 50 meters. What is its velocity just before it hits the ground?

Answer:

$$vf = \sqrt{2gh} = \sqrt{29.850} = 31.3 \text{ m/s}^*$$

Explanation:

The final velocity of an object dropped from a height can be calculated using the formula $vf = \sqrt{2gh}$, where g is the acceleration due to gravity and h is the height.

Question 2:

A force of 50 Newtons is applied to an object with a mass of 5 kg. What is the object's acceleration?

Answer:

$$a = F/m = 50 \text{ N} / 5 \text{ kg} = 10 \text{ m/s}^2$$

Explanation:

According to Newton's second law, the acceleration of an object is directly proportional to the force applied and inversely proportional to its mass.

Question 3:

A projectile is launched horizontally at a speed of 20 m/s. Its initial height above the ground is 10 meters. What is its horizontal displacement when it hits the ground?

Answer:

$$x = vt = 20 \text{ m/s} \sqrt{2 \cdot 10 \text{ m} / 9.8 \text{ m/s}^2} = 41.0 \text{ m}$$

Explanation:

To calculate the horizontal displacement, we need to determine the time it takes for the projectile to fall to the ground. We can use the formula $t = \sqrt{2h/g}$ to find this time.

Question 4:

A charged particle is moving in a magnetic field. The magnetic field is perpendicular to the particle's velocity. What is the path of the particle?

Answer:

The particle will move in a circle.

Explanation:

A charged particle moving in a magnetic field experiences a force perpendicular to both its velocity and the magnetic field. This force causes the particle to move in a

circular path.

Question 5:

A simple pendulum has a length of 1 meter. What is the period of oscillation?

Answer:

$$T = 2\pi\sqrt{L/g} = 2\pi\sqrt{1 \text{ m} / 9.8 \text{ m/s}^2} = 2.01 \text{ s}^*$$

Explanation:

The period of oscillation for a simple pendulum is given by the formula $T = 2\pi\sqrt{L/g}$, where L is the length of the pendulum and g is the acceleration due to gravity.
