### Question 1

A beam of length  $L$  is simply supported at its ends and subjected to a uniformly distributed load of intensity  $w$ . Determine the maximum bending moment in the beam.

### Answer

The maximum bending moment in the beam occurs at the center of the beam and is given by:

$$M = (w * L^2) / 8$$

### Question 2

A shaft is subjected to a torsional moment of  $T$ . Determine the maximum shear stress in the shaft.

### Answer

The maximum shear stress in the shaft occurs at the outer surface of the shaft and is given by:

$$\tau = T * r / J$$

where  $r$  is the radius of the shaft and  $J$  is the torsional constant.

### Question 3

A column of height  $L$  is fixed at its base and free at its top. Determine the critical buckling load for the column.

### Answer

The critical buckling load for the column is given by:

$$P = (\pi^2 * E * I) / (L^2)$$

where  $E$  is the modulus of elasticity of the material and  $I$  is the area moment of inertia of the column.

#### Question 4

A plate is subjected to a tensile stress of  $\sigma$ . Determine the strain in the plate.

#### Answer

The strain in the plate is given by:

$$\epsilon = \sigma / E$$

#### Question 5

A wire of length  $L$  is stretched by a force of  $F$ . Determine the Young's modulus of the material of the wire.

#### Answer

The Young's modulus of the material of the wire is given by:

$$E = (F * L) / (A * \Delta L)$$

where  $A$  is the cross-sectional area of the wire and  $\Delta L$  is the change in length of the wire.
