## **Unit 1 Biochemistry: Chapter 2 Cell Structure**

### **Questions and Answers**

#### **1. What are the main components of a cell?**

Cells are composed of three main components: the cell membrane, the cytoplasm, and the nucleus. The cell membrane surrounds the cell and controls the movement of substances in and out of the cell. The cytoplasm contains all the organelles, which are specialized structures that perform specific functions within the cell. The nucleus is the control center of the cell and contains the genetic material.

#### **2. What is the function of the nucleus?**

The nucleus contains the cell's genetic material, which is organized into chromosomes. These chromosomes contain DNA, which provides the instructions for the cell's activities. The nucleus also contains the nucleolus, which produces ribosomes, the structures that assemble proteins.

### **3. What are the different types of organelles?**

There are many different types of organelles, each with a specific function. Some of the most common organelles include:

- Mitochondria: Produce energy
- Endoplasmic reticulum: Produces and transports proteins
- Golgi apparatus: Modifies and packages proteins
- Lysosomes: Digest waste products
- Ribosomes: Assemble proteins

### **4. What is the difference between a prokaryotic and a eukaryotic cell?**

Prokaryotic cells are smaller and simpler than eukaryotic cells. They do not have a nucleus or other membrane-bound organelles. Eukaryotic cells, on the other hand, have a nucleus and a variety of membrane-bound organelles.

### **5. How does the cell membrane control the movement of substances in and out of the cell?**

The cell membrane is a phospholipid bilayer, which is a double layer of lipids. This bilayer is impermeable to most substances. However, the cell membrane contains proteins that can transport substances across the membrane. These proteins can be either channels or pumps. Channels allow substances to pass through the membrane without the need for energy. Pumps require energy to transport substances across the membrane.
