1. What is the Decision Problem?

The decision problem is to determine whether a given input belongs to a specified language. For example, given a regular expression, we want to determine if a string matches the expression.

2. What is the Pumping Lemma for Regular Languages?

The pumping lemma for regular languages states that if a language is regular, then every sufficiently long string in the language can be "pumped" (repeated) to produce a new string that is still in the language.

3. What is the Myhill-Nerode Theorem?

The Myhill-Nerode theorem states that two strings belong to the same equivalence class of a regular language if and only if they have the same suffix set. This theorem provides an alternative characterization of regular languages.

4. What is the Context-Free Grammar (CFG)?

A context-free grammar (CFG) is a formal description of a language. It consists of a set of production rules that specify how to construct strings in the language. CFGs can generate languages that are not regular.

5. What is the Chomsky Hierarchy?

The Chomsky hierarchy is a classification of formal languages based on their generative power. It includes four levels: regular languages, context-free languages, context-sensitive languages, and recursively enumerable languages. Each level has a more powerful generative capacity than the lower levels.
