Signals and Systems Using MATLAB by Luis Chaparro: Solution Manual

Q1: How does the MATLAB code in Chapter 3 solve for the convolution of two continuous-time signals?

A1: The provided MATLAB code utilizes the `conv()` function to compute the convolution integral of two input continuous-time signals. The result is effectively a discrete-time representation of the continuous-time convolution.

Q2: Explain the purpose of the `fft()` function in Chapter 4.

A2: The `fft()` function performs the fast Fourier transform (FFT) on a given input sequence. It converts a time-domain signal into its frequency-domain representation, providing insights into the signal's spectral characteristics.

Q3: How does the MATLAB code in Chapter 5 implement a digital filter using the `filter()` function?

A3: The `filter()` function in Chapter 5 allows users to design and apply digital filters to input sequences. It takes as inputs the filter coefficients and the input signal, producing the filtered output.

Q4: What is the significance of the Nyquist rate mentioned in Chapter 6?

A4: The Nyquist rate is the minimum sampling frequency required to accurately reconstruct a continuous-time signal from its sampled version. Exceeding the Nyquist rate ensures no aliasing occurs during the sampling process.

Q5: How does the MATLAB code in Chapter 7 generate a phase-locked loop (PLL) simulation?

A5: The provided MATLAB code in Chapter 7 models a PLL system using the `pll()` function. It simulates the behavior of the PLL, allowing users to observe its response to input signals and analyze its locking characteristics.
