### **You Don't Know JS: Scope & Closures**

**Q1: What is Scope?** Scope refers to the accessibility of variables, functions, and other identifiers within a JavaScript program. Variables declared within a scope can only be accessed within that scope. There are two types of scopes in JavaScript: global scope and function scope. Global scope encompasses the entire program, while function scope encompasses the code within a function.

**Q2: What is a Closure?** A closure is a function that has access to the variables of its outer scope, even after the outer scope has finished executing. This allows closures to maintain state and preserve access to data that would otherwise be inaccessible.

**Q3: How Do Closures Work?** When a closure is created, it captures the variables and functions from its surrounding scope. These captured values remain accessible within the closure even after the surrounding scope has been destroyed. Closures rely on the JavaScript execution context, which keeps track of the variables and functions available to each part of the program.

**Q4: What are the Benefits of Closures?** Closures offer several benefits, including:

- **Data privacy:** Closures allow you to protect data from being modified or accessed outside of the intended scope.

- State management: Closures can maintain state and preserve values between function calls, even when the surrounding context has changed.
- Modularity: Closures encapsulate data and behavior, making it easier to reuse code and organize complex programs.

**Q5: What are Some Common Use Cases for Closures?** Closures have a wide range of applications, such as:

- Preserving state in event handlers
- Creating private variables and methods
- Implementing currying and partial functions
- Defining asynchronous callbacks
