It then progresses to discuss all aspects of clinical endodontics.

**What is the pulp nerve?** Nerves in your dental pulp help protect your tooth by allowing you to sense damage to your tooth as well as changes in temperature or pressure. Your tooth pulp is the only part of your tooth that contains blood vessels and nerves. If your pulp becomes severely damaged, your tooth will lose its blood and nerve supply.

**What are the 4 zones of pulp?** The pulp cavity exhibits four zones as you progress from the dentin-pulp junction toward the center of the pulp cavity: 1) the odontoblast zone, 2) cell-free zone (basal layer of Weil), 3) cell-rich zone, and 4) the pulp core.

**What are the three parts of the pulp?** Pulp chamber: The main upper portion, contained in the crown of your tooth. Pulp horns: Extensions of the pulp chamber that curl up toward the chewing surface of your tooth. Radicular canals: Extensions of the pulp chamber that travel down the length of the roots, all the way to the apex (tip).

**What is the primary function of the pulp?** Put simply, the main four functions of the pulp are formation and nutrition of the dentin, as well as the innervation and defense of the tooth. Dentin formation is one of the most critical roles carried out by

the pulp and, as mentioned, is formed by the odontoblasts.

Worn tooth enamel: This can be a result of aggressive brushing or grinding your teeth. The worn areas can allow bacteria to enter your tooth.

**What is the hardest substance in the body?** Encasing your teeth and helping you chew, bite, and tear your food is your tooth enamel. That's the hardest substance in the human body.
