Thermal Engineering by RS Khurmi: Questions and Answers

1. What is the concept of thermal conductivity? Thermal conductivity is a measure of a material's ability to conduct heat. It is defined as the amount of heat transferred per unit time through a unit area of the material with a unit temperature gradient.

2. Explain the significance of entropy in thermal systems. Entropy is a measure of the randomness or disorder of a system. In thermal systems, entropy increases as heat is transferred from a high-temperature reservoir to a low-temperature reservoir. This increase in entropy reflects the tendency of thermal energy to spread out and become more evenly distributed.

3. Describe the working principle of a Rankine cycle. A Rankine cycle is a thermodynamic cycle used in power plants to generate electricity. It involves four processes: heat addition, isentropic expansion, heat rejection, and isentropic compression. The cycle converts heat energy into mechanical energy, which is then used to drive a generator.

4. Explain the concept of radiative heat transfer. Radiative heat transfer is the transfer of heat through electromagnetic waves. It does not require a medium and can occur through a vacuum. The emissivity of a material determines its ability to emit radiative heat.

5. Discuss the importance of thermal resistance in heat transfer. Thermal resistance is a measure of the resistance to heat flow through a material. It is defined as the temperature difference between two points divided by the rate of heat flow. Thermal resistance is an important factor in designing thermal systems to ensure efficient heat transfer.
