Signals and Systems Using MATLAB by Luis Chaparro: Solution Manual

Question 1: How can you determine if a sequence is a periodic signal?

Answer: A sequence is considered periodic if it repeats itself after a fixed interval. In MATLAB, you can calculate the period of a sequence using the `periodogram` function.

Question 2: What is the use of the Fourier transform in signal analysis?

Answer: The Fourier transform converts a signal from the time domain to the frequency domain. This allows for analyzing the frequency components of a signal and identifying its spectral content. MATLAB provides the `fft` and `ifft` functions for performing Fourier transforms.

Question 3: How do you represent a discrete-time system using a difference equation?

Answer: A difference equation is a mathematical equation that relates the current output of a system to its previous outputs and inputs. In MATLAB, you can represent a discrete-time system using the `dl Sims` function, which simulates the system using a difference equation.

Question 4: What is the relationship between the z-transform and the Fourier transform?

Answer: The z-transform is an extension of the Fourier transform that applies to discrete-time signals. It is obtained by replacing the frequency variable in the Fourier transform with a complex variable. MATLAB's `ztrans` function can be used to calculate the z-transform of a signal.

Question 5: How do you analyze the stability of a discrete-time system using the unit circle?

Answer: The unit circle is a graphical representation of the complex plane with a radius of 1. A discrete-time system is considered stable if all of its poles lie within the unit circle. In MATLAB, you can use the `pole` and `zplane` functions to visualize the poles of a system and determine its stability.
