### **Thomas' Calculus: Engineering Mathematics (1st Edition)**

#### **Q1: What is the Fundamental Theorem of Calculus (FTC)?**

**A:** The FTC establishes a connection between the integral and derivative of a function. It states that the integral of a function from  $a$  to  $b$  equals the net change in the function's value over the interval  $[a, b]$ . Conversely, the derivative of an integral is the original function.

#### **Q2: How is integration used to find areas and volumes?**

**A:** Integration is a powerful tool for calculating the area under a curve and the volume of solids generated by rotations or cross-sections. For example, integrating a function  $f(x)$  over an interval  $[a, b]$  gives the area under the curve  $y = f(x)$  from  $a$  to  $b$ . Similarly, integrating the cross-sectional area of a solid over its height or length gives its volume.

#### **Q3: What are differential equations (DEs)?**

**A:** DEs are equations that relate a function to its derivatives. They are used to model a wide range of phenomena, such as population growth, motion, and heat transfer. DEs can be solved using analytical methods or numerical techniques.

**Q4: How are Taylor polynomials used to approximate functions?**

**A:** Taylor polynomials provide an approximation of a function  $f(x)$  near a point  $a$ . The  $n$ th-order Taylor polynomial, denoted by  $P_n(x)$ , is a polynomial of degree  $n$  that agrees with the function's value, first derivative, second derivative, and so on, up to the  $n$ th derivative at the point  $a$ .

**Q5: What are the applications of Fourier series and Fourier transforms in engineering?**

**A:** Fourier series expand a periodic function into a sum of sines and cosines. They are used to analyze periodic signals, such as waveforms in electronics and vibrations in mechanics. Fourier transforms generalize Fourier series to non-periodic functions and are widely used in image processing, signal analysis, and heat transfer.
