Wiring of Pickups with 4 Conductor Cable: FAQs

Pickups with 4 conductor cables provide greater versatility than those with traditional 2 conductor cables, allowing for a wider range of wiring configurations and tone options. Here are some frequently asked questions and answers about wiring pickups with 4 conductor cables:

1. What is the advantage of using a 4 conductor cable? 4 conductor cables give you access to coil splitting, which allows you to combine the output of the two coils in different ways to create different sounds. For example, you can have one coil on for

a single coil sound, both coils on for a humbucking sound, or one coil in phase and the other out of phase for a unique, quacky sound.

2. How do I wire a pickup with a 4 conductor cable? The 4 conductors are typically color-coded as follows:

- Black: Ground
- White: Hot (coil 1)
- Red: Hot (coil 2)
- Green: Shield

To wire the pickup, connect the black conductor to ground, the white conductor to the hot input of the switch, the red conductor to the other hot input of the switch, and the green conductor to ground.

3. What is the difference between series and parallel wiring? Series wiring connects the coils in series, so the output of one coil is fed into the input of the other. This results in a higher output and a fuller sound. Parallel wiring connects the coils in parallel, so the output of both coils is mixed together. This results in a lower output and a brighter sound.

4. What is the best wiring configuration for my pickup? The best wiring configuration for your pickup depends on your personal preferences and the sound you want to achieve. Experiment with different combinations of series and parallel wiring, and see which one sounds best to you.

5. Can I use a 4 conductor cable with a 2 conductor pickup? Yes, you can use a 4 conductor cable with a 2 conductor pickup. However, you will not be able to access all of the wiring configurations that are available with a 4 conductor pickup. The black and green conductors can be connected together and treated as a single ground conductor, while the white and red conductors can be connected together and treated as a single hot conductor.
