### **Wired for Story: The Science of Hooking Readers from the Start**

Our brains are hardwired to crave stories. From epic sagas to captivating novels, storytelling captivates our attention and transports us to new worlds. But how do writers hook readers from the very first sentence? The answer lies in the neuroscience of storytelling.

- **Q: Why are humans drawn to stories?**

- A: Evolutionarily, stories helped us learn and survive by providing insights into social norms, dangers, and opportunities. Our brains are still wired to seek out and engage with narratives.

- **Q: How does the brain process stories?**

- A: When we read or hear a story, our brain regions responsible for language, imagery, and emotion work together to create a mental representation of the events. This process activates empathy circuits, making us feel connected to the characters and their experiences.

- **Q: What makes a compelling opening sentence?**

- A: Effective opening sentences often employ literary devices such as sensory details, vivid imagery, or surprising twists. They arouse curiosity, evoke emotion, and hint at the broader narrative without giving away too much.

- **Q: Can science help writers create more engaging openings?**

- A: Yes. Research in cognitive psychology has identified several principles that can guide writers in writing compelling openings. One key principle is "novelty," which suggests that new or surprising information grabs attention and keeps readers engaged.

- **Q: How can writers apply these principles to their writing?**

- A: Writers can experiment with using unconventional perspectives, challenging assumptions, or revealing unexpected details in their opening sentences. By tapping into the brain's innate craving for novelty, they can create openings that spark intrigue and leave readers clamoring for more.

## **WHO Classification of Tumours of Haematopoietic and Lymphoid Tissues**

### **Q: What is the WHO Classification of Tumours of Haematopoietic and Lymphoid Tissues?**

A: The WHO Classification of Tumours of Haematopoietic and Lymphoid Tissues is a comprehensive reference guide for classifying cancers and tumours affecting the blood, bone marrow, and lymphatic system. It is published by the World Health Organization (WHO) and provides a standardized system for diagnosing and classifying these diseases.

### **Q: What are some of the key features of the WHO Classification?**

WIRED FOR STORY THE WRITERS TO USING BRAIN SCIENCE TO HOOK READERS FROM  
THE V

A: The WHO Classification follows a morphological approach, which means it classifies tumours based on their microscopic appearance. It includes definitions and diagnostic criteria, as well as guidelines for interpreting laboratory findings. The classification is regularly updated to reflect advances in diagnostic techniques and molecular understanding of cancer.

**Q: What are the different categories of tumours included in the WHO Classification?**

A: The WHO Classification includes a wide range of tumours of haematopoietic and lymphoid origin, including:

- Leukaemias
- Lymphomas
- Myelomas
- Histiocytic and dendritic cell neoplasms
- Mast cell tumours
- Other myeloid and lymphoid neoplasms

**Q: How is the WHO Classification used in clinical practice?**

A: The WHO Classification is used by pathologists, haematologists, and oncologists to diagnose and classify blood cancers. It helps guide treatment decisions, prognosis, and monitoring of patients with these diseases. The classification also facilitates communication and data sharing among healthcare professionals involved in the care of patients with haematopoietic and lymphoid neoplasms.

**Q: What are the benefits of using the WHO Classification?**

A: The WHO Classification provides a common language for describing and classifying blood cancers, reducing confusion and ensuring consistency in diagnosis and treatment. It also promotes collaboration among researchers and clinicians, contributing to advancements in diagnosis, treatment, and understanding of these diseases.
