ISTA is designed to be tailored to more specific situations or package configurations. The different series offer variety in cost and complexity.

**What is ISTA 3A?** Test Procedure 3A is a general simulation test for individual packaged-products shipped through a parcel delivery system. The test is appropriate for four different types of packages commonly distributed as individual packages,

either by air or ground. The types include standard, small, flat and elongated packages.

**What is the difference between ASTM D4169 16 and 22?** While most of the testing standard remained the same, changes were made to the air vibration profile. D4169-16 is limited to three assurance levels (I, II, or III) and 4 frequencies (2, 12, 100, and 300 Hz). D4169-22 uses low, medium, and high density levels and 6 frequencies (1, 2, 42, 50, 120, and 200 Hz).

**What is pull out test as per ASTM?** Summary of Test Method When an estimate of the in-place strength is desired the insert is pulled by means of a jack reacting against a bearing ring. The pullout strength is determined by measuring the maximum force required to pull the insert from the concrete mass.

**What is the ISO standard for flexural test?** ISO 178 is used to determine the flexural properties of plastics. This test measures the flexural stress, strain, and modulus of rigid and semi-rigid plastics. The test uses a universal testing machine and a three point bend fixture to bend plastic test bars to acquire the data needed to make the calculations.

**How to calculate flexural modulus?** By dividing the value of the stress at the end of the linear portion by the value of the strain at that point, the flexural modulus can be determined.

**What is the sample size for flexural test?** A variety of specimen shapes can be used for this test, but the most commonly used specimen size for ASTM is 3.2mm x 12.7mm x 125mm (0.125" x 0.5" x 5.0") and for ISO is 10mm x 4mm x 80mm.

**What is the difference between ASTM D4169 14 and 16?** The difference between ASTM D4169-14 and ASTM D4169-16 is how the truck vibration testing is performed. ASTM D4169-14 utilizes static assurance levels for the truck vibration profile. An assurance level is the overall intensity level that you are going to subject your packages to while undergoing vibration.

**What is ASTM D for Charpy impact test?** ASTM D6110 defines the method used to determine the resistance of plastic to breakage when impacted in a three point bend configuration, using a pendulum system with an appropriately sized hammer arm. The test is typically uninstrumented and is used to determine the energy required to break the specimen.

**What is the IEC standard for drop test?** The drop test is conducted on handheld or hand-guided (i.e., electrode) devices, and each of three samples is to be dropped three times from a height of 1.22 m (4 ft) onto a tile-covered concrete surface. The IEC 60601-1 drop test is from 1 m, and only one sample is dropped three times.
