overheating.

**What is the cause of air compressor overheating?** If your compressor doesn't undergo regular maintenance, then dirty broken filters, pipe blockage, and blocked interior components could lead to overheating.

**What is air compressor rating?** CFM is cubic feet per minute, which indicates the compressor's flow rate - or the amount of air that a compressor can produce at a given pressure level. Typically, compressors that have higher CFM ratings are able to provide more air, which makes them ideal for larger applications.

**Can I use regular oil in my air compressor?** While you could technically use motor oil to operate an air compressor, that oil type typically contains detergents that will cause carbon build-up within a compressor unit.
