The set formula is given in general as $n(A \cup B) = n(A) + n(B) - n(A \cap B)$, where A and B are two sets and $n(A \cup B)$ shows the number of elements present in either A or B and $n(A \cap B)$ shows the number of elements present in both A and B.

Although objects of any kind can be collected into a set, set theory — as a branch of mathematics — is mostly concerned with those that are relevant to mathematics as a whole.

What does n mean in sets? We designate these notations for some special sets of numbers: \mathbb{N} =the set of natural numbers, \mathbb{Z} =the set of integers, \mathbb{Q} =the set of rational numbers, \mathbb{R} =the set of real numbers.

How do you solve set solutions?

What is the formula for the basic set theory? The general set formula is expressed as $n(A \cup B) = n(A) + n(B) - n(A \cap B)$, where A and B represent two sets. Here, $n(A \cup B)$ denotes the count of elements existing in either set A or B, while

$n(A \cap B)$ indicates the count of elements shared by both sets A and B.

How do you solve set operations? Set operation formula for union of sets is $n(A \cup B) = n(A) + n(B) - n(A \cap B)$ and set operation formula for intersection of sets is $n(A \cap B) = n(A) + n(B) - n(A \cup B)$. The union of any set with the universal set gives the universal set and the intersection of any set A with the universal set gives the set A.
