## **Software Engineering Interview Questions with Answers**

Software engineering interviews often include technical questions to assess a candidate's skills and knowledge. Here are some common questions and their answers:

### **1. Explain the difference between object-oriented and functional programming.**

- **Object-oriented programming (OOP):** Objects encapsulate data and behavior, emphasizing inheritance and polymorphism.
- **Functional programming:** Functions are the fundamental units of computation, stressing immutability and declarative programming.

### **2. What is the difference between a linked list and an array?**

- **Linked list:** A collection of nodes, each containing a value and a reference to the next node. Linked lists are good for dynamic data structures and inserting/deleting elements.
- **Array:** A contiguous block of memory containing elements of the same data type. Arrays are more efficient for random access but less flexible for dynamic structures.

### **3. Describe the SOLID principles of software design.**

- **Single responsibility principle:** Each class or module should have a single, well-defined purpose.
- **Open-closed principle:** Software should be open to extension but closed to modification.
- **Liskov substitution principle:** Objects should be replaceable by instances of their subclasses without breaking the system.

- **Interface segregation principle:** Multiple specialized interfaces are better than a single general interface.
- **Dependency inversion principle:** High-level modules should depend on abstractions, not concrete implementations.

#### 4. Explain the concept of polymorphism.

Polymorphism allows different objects to respond to the same method call with different behaviors. This is achieved through inheritance or interface implementation, enabling code reusability and flexibility.

#### 5. What is the role of a software testing engineer?

Software testing engineers design, execute, and analyze tests to ensure the quality and correctness of software systems. Their primary goal is to identify and report defects before the software is released to production.
