Why does hydrogen only emit four colors? It is because the electrons can only be in these distinct orbitals. Look at the following applet and start with hydrogen. When a broad visible spectrum of light shines on hydrogen, notice it only removes 4 wavelengths of light.

Why is the bright line spectrum unique to each element? Different elements have different spectra because they have different numbers of protons, and different numbers and arrangements of electrons. The differences in spectra reflect the differences in the amount of energy that the atoms absorb or give off when their electrons move between energy levels.

Why doesn't an electron jump into the nucleus? Quantum mechanics states that among all the possible energy levels an electron can sit in the presence of a nucleus, there is one, which has THE MINIMAL energy. This energy level is called the ground state. So, even if atoms are in a very very called environment, QM prohibits electrons from falling to the nucleus.
