What is cumulative incidence for competing risks? Cumulative incidence function is a proper summary statistics for analyzing competing risks data. Cumulative incidence function is estimated by modeling the cause-specific hazard function of all causes. Gray's test compare the cumulative incidence function directly.

What is the log rank test for competing risk? The competing risk log-rank test, logrank , is a test of the null hypothesis $H_0: \lambda_j(t) = \lambda_l(t)$ for all t for some horizon time point $t > 0$ where λ_j, λ_l are the cause- j specific hazard rates in the left and the right daughter nodes.

What is the theory of competing risks? Competing risks (CR) are events which prevent the occurrence or modify the risk of the primary event or outcome of interest [2]. In the absence of CR, estimating cumulative incidence of events over time via the complement of the Kaplan-Meier function (1 minus Kaplan-Meier function) is appropriate.

When to use competing risks? A competing risk analysis is therefore most appropriate when there are competing events to the primary outcome of interest. The most commonly used multivariable model in these situations is the Fine-Gray model.

What is the difference between Kaplan-Meier and competing risk? In competing risk analysis, individuals experiencing the competing risk event have zero probability of experiencing the event of interest. In contrast, the naïve Kaplan-Meier approach assumes that these individuals would experience the same probability of event of interest in pure theory (non-informative censoring).

Is log rank the same as Kaplan-Meier? The logrank test is similar to the Kaplan-Meier analysis in that all cases are used to compare two or more groups e.g. treated versus control group in a randomised trial.

What is the Kaplan-Meier method? The Kaplan-Meier method estimates survival by censoring patients who have died and assuming the lifetime span of the survivors will be the same as for those who have already died. The Kaplan-Meier method estimates rates of nonfatal events, for example, SVD, by censoring patients who have died without SVD.
