Subnet Training Guide for Students and Instructors

1. What is a subnet?

A subnet is a logical subdivision of an IP network. It allows administrators to divide a large network into smaller, more manageable segments. Each subnet has its own unique IP address range and subnet mask.

2. Why use subnets?

There are several reasons to use subnets:

- To improve network performance by reducing broadcast traffic
- To enhance network security by isolating different parts of the network
- To make network administration easier by organizing the network into smaller groups

3. How to create a subnet

To create a subnet, you need to know:

- The IP address of the network
- The subnet mask
- The range of IP addresses that you want to use for the subnet

Once you have this information, you can create the subnet using the following steps:

1. Convert the IP address to binary.
2. Convert the subnet mask to binary.
3. Apply the subnet mask to the IP address to create the subnet ID.
4. Subtract the subnet ID from the IP address to create the range of IP addresses for the subnet.

4. How to configure a subnet

Once you have created a subnet, you need to configure it on your router. To do this, you will need to enter the following information:

- The subnet ID
- The subnet mask
- The default gateway

5. Troubleshooting subnet issues

If you are experiencing problems with your subnet, you can try the following troubleshooting steps:

- Check the subnet mask to make sure that it is correct.
- Check the IP addresses of the devices on the subnet to make sure that they are in the correct range.
- Check the default gateway to make sure that it is reachable.
