Similarity, Congruence, and Proofs: Answer Key

Paragraph 1:

- **Question 1:** Define similarity.
- **Answer 1:** Similarity is the property where two figures have the same shape but not necessarily the same size. Corresponding angles are congruent, and corresponding sides are proportional.

Paragraph 2:

- **Question 2:** What is congruence?
- **Answer 2:** Congruence is the property where two figures have the same size and shape. Corresponding angles are congruent, and corresponding sides are equal in length.

Paragraph 3:

- **Question 3:** State the SSS (Side-Side-Side) Congruence Theorem.
- **Answer 3:** If three sides of one triangle are congruent to three sides of another triangle, then the triangles are congruent.

Paragraph 4:

- **Question 4:** What is the AA (Angle-Angle) Similarity Theorem?
- **Answer 4:** If two angles of one triangle are congruent to two angles of another triangle, then the triangles are similar.

Paragraph 5:

- **Question 5:** Explain how to prove triangles congruent using the HL (Hypotenuse-Leg) Theorem.

- **Answer 5:** If the hypotenuse and one leg of a right triangle are congruent to the hypotenuse and one leg of another right triangle, then the triangles are congruent.

Triangulation Development Method in Engineering Drawing

Triangulation development is a method used in engineering drawing to create a true shape of a three-dimensional object on a two-dimensional surface. It involves dividing the object into smaller triangles, and then developing the triangles into flat shapes on the drawing.

What is the purpose of using triangulation development?

Triangulation development is used to create accurate representations of three-dimensional objects on two-dimensional drawings. This allows engineers and designers to visualize the object's shape and dimensions, and to make calculations and design decisions based on these representations.

How is triangulation development performed?

Triangulation development is performed by first dividing the object into smaller triangles. The triangles are then drawn on the drawing surface, and their sides are dimensioned. The triangles are then developed into flat shapes, by drawing lines parallel to the base of each triangle, and measuring the distances between the lines.

What are the advantages of using triangulation development?

Triangulation development is a relatively simple and accurate method for creating representations of three-dimensional objects on two-dimensional drawings. It is also a versatile method that can be used to create representations of a wide variety of objects.

What are the disadvantages of using triangulation development?

Triangulation development can be time-consuming, especially for complex objects. It can also be difficult to create accurate representations of some objects, such as objects with curved surfaces.
