infections in immunocompromised individuals.

**Are fungi a pathogen?** More than 600 fungal species are associated with humans, either as commensals and members of our microbiome or as pathogens that cause some of the most lethal infectious diseases (2–4).

**Do fungi need a host?** They must penetrate human, animal, or plant cells, and then multiply. Without a host, they eventually die on their own. Like bacteria, fungi also occur in different environments. Moulds, for example, like damp conditions, which is why they are often found in clammy walls, flowerpots, niches in the bathroom, or in food.

**Which vitamin deficiency causes fungal infection?** Dermatologic signs of biotin deficiency include thinning of hair and hair loss, patchy red rash (most commonly near the mouth), seborrheic dermatitis and fungal skin and nail infections. Other conditions associated with biotin deficiency include hallucinations, lethargy, anorexia, depression, myalgia and paresthesias.

**What is the fastest way to get rid of skin fungus?** Typically, a course of antifungal creams (either prescription or over-the-counter) will clear up the rash and relieve the itchiness. Your healthcare provider can also discuss preventive steps to keep the rash from coming back.

**How do you treat a chronic fungal infection?** Fungal infections are typically treated with antifungal medications, usually with ones that are applied directly to the affected area (called topical medications). Topical medications may include creams, gels, lotions, solutions, or shampoos. Antifungal medications may also be taken by mouth.

**Why is fungal infection difficult to treat?** This is because fungal cells are similar in many ways to human cells. “So it’s very hard to find an antifungal that’s able to kill the fungus without also hurting human cells,” he says. NIH-funded researchers are working on developing new antifungal drugs with fewer side effects.

**How do fungal infections start?** Fungi reproduce by spreading microscopic spores. These spores are often present in the air and soil, where they can be inhaled or come into contact with the surfaces of the body, primarily the skin. Consequently,

fungal infections usually begin in the lungs or on the skin.

**Can fungi control humans?** And while the prospect of fungus being able to manipulate human behavior isn't impossible, it's not likely, according to Dentinger. The traits the fungus have that allow them to attack an insect host are very specific to that insect — and it's not easily transferable to another species.

Considering its demonstrated antifungal and antibiofilm properties, vitamin D3 holds promise as a potential agent for medical applications.

**What vitamin gets rid of fungus?** Vitamin B-3 exerts potent anti-fungal activity, and researchers believe it may serve as a potential anti-fungal treatment. Human studies are needed to confirm this, though. Candida albicans, a common cause of fungal infections, uses an enzyme known as Hst-3 to grow and multiply.

## Silting Problems in Hydropower Plants: Q&A

**Q: What is silting, and how does it affect hydropower plants?** **A:** Silting refers to the accumulation of sediment in the reservoir and waterways of a hydropower plant. Sediment can clog turbines, reduce water flow, and cause erosion, leading to decreased power generation efficiency and increased maintenance costs.

**Q: What are the main sources of sediment in hydropower plants?** **A:** Sources of sediment include upstream erosion from land use changes, natural disasters (e.g., landslides, floods), and improper sediment management practices. Sediment can

also be transported into the reservoir during heavy rainfall events.

**Q: What are the consequences of silting in hydropower plants?** A: Silting can have several adverse effects on hydropower plants, including:

- Reduced turbine efficiency
- Increased maintenance costs
- Reduced water flow capacity
- Damage to equipment and infrastructure
- Environmental degradation

**Q: How can silting be prevented or mitigated in hydropower plants?** A: Several strategies can be employed to mitigate silting in hydropower plants, such as:

- Implementing sediment control measures upstream
- Regular sediment removal from the reservoir and waterways
- Designing plants with sediment bypass systems
- Sedimentation modeling and monitoring

**Q: What are some best practices for managing silting in hydropower plants?**

A: Best practices for managing silting include:

- Continuous monitoring of sediment levels
- Regular inspection and maintenance of sediment control structures
- Coordination with upstream stakeholders to implement erosion control measures
- Developing and implementing a comprehensive sediment management plan
