As you go horizontally from left to right across a Period in the Periodic Table, you are adding one more proton to the nucleus (increasing the atomic number by one).

How to answer a periodic table? Long answer: The Periodic Table is arranged in columns, numbered 1 to 8 and the group number is the same as the number of

electrons in the outer shell of the atom. This means that all of the elements which are found in group 4 (carbon, silicon, germanium etc) will all have four outer electrons.

What is the best trick for the periodic table? You could use the acronym HHeLiBeBCNOF (pronounced 'heeliebeb kernoff') to remember the first nine chemical elements. It's a nonsense word, but it condenses nine names into one mental prompt or cue.
